## Acknowledgments

Many people have contributed comments, suggestions, design ideas, questions (and answers), bug reports, and code to GBBopen, and we appreciate their time and effort. Acknowledgment of some of their contributions here does not necessarily imply that any individual or the organizations with which they are affiliated endorse GBBopen or this documentation. Disclaimers aside, GBBopen users thank each of you!

Douglas Crosher ported GBBopen to [Sciener CL](#). [Gary King](#) worked on the initial [Digitool MCL](#) and [OpenMCL](#) porting efforts. Christian Lynbech performed the initial CMUCL port. [Sam Steingold](#) initiated the [CLISP](#) port. Vladimir Tzankov provided Portable Threads support for [CLISP/MT](#).

Questioners, bug reporters, capability demanders, contributors, and great idea suggesters include: [Pascal Costanza](#), Matthew Danish, Michael Hannemann, Susan Lander, Attila Lendvai, Wendall Marvel, [Clayton Morrison](#), Beryl Nelson, Eric O'Connor, [Zack Rubinstein](#), Bill St. Clair, Earl Wagner, Paul Werkowski, and [Huzafa Zafar](#).

**Organizations** [Franz Inc.](#) and [LispWorks Ltd.](#) provided (and continue to provide) Common Lisp licenses and technical support to the Project.

Some early design work for GBBopen was supported by DARPA's Information Exploitation Office ([IXO](#)) under contract MDA-972-02-C-0028 to [Information Extraction & Transport, Inc.](#)

Other efforts using GBBopen that have indirectly led to contributed GBBopen improvements and enhancements include: research supported by the "Fusion Based Knowledge for the Future Force" ATO program and the "Advanced REsearch Solutions - Fused Intelligence with Speed and Trust" program at the U.S. Army RDECOM CERDEC Intelligence and Information Warfare Directorate, Fort Monmouth, NJ, under contract W15P7T-05-C-P621; research on "Command & Control and Data Fusion Architectures" supported by DND Canada under contract W7701-4-2118; work on "Knowledgeable Dynamic-Process Modeling and Execution" supported by Boeing and Infosys Technologies Limited; research on "A Multi-Agent Approach for Heterogeneous Persistent Surveillance" supported by Raytheon Intelligence & Information Systems; work on "Massive-Scale Representation and Reasoning" supported by GHX; and research supported by the AFRL "Advanced Computing Architecture" program, under contract FA8750-05-1-0039.

**Legacy Contributors** GBBopen builds upon concepts and ideas that were explored and refined in the UMass Generic Blackboard system and the commercial GBB product. The following people made significant contributions to those systems:

Kevin Gallagher	Dan Corkill
Philip Johnson	Raymond de Lacaze
Kelly Murray	Kevin Gallagher
	Susan Lander
	Zack Rubinstein
	Suzanne Tromara

The UMass Generic Blackboard Project received research support from The National Science Foundation, the Defense Advanced Research Projects Agency, the Office of Naval Research, and Texas Instruments, Inc.

# Introduction

GBBopen is a modern, high-performance, open source blackboard-system development environment that is based on the concepts that were explored and refined in the [UMass Generic Blackboard system](#) and the commercial GBB product. GBBopen is not, however, a clone or updated version of either system. The GBBopen Project is applying the knowledge and experience gained with these earlier tools to create a new generation of blackboard-system capabilities and make them freely available to a wide audience.

GBBopen is structured for high-performance and scalability while maintaining flexibility and adaptability to changes in representation, knowledge-source (KS) components, and control strategies. Multi-dimensional abstraction of blackboard components (“space instances”), blackboard objects (“unit instances”), and proximity-based retrieval patterns is used to provide a semantically meaningful separation of blackboard-repository storage mechanisms from KS and control code. This separation allows storage and search strategies and optimizations to change dynamically as well as to be adapted to a broad range of application areas. GBBopen also provides highly efficient and extensible event primitives that form the foundation for fast, yet effective, opportunistic control reasoning.

At the implementation level, GBBopen is designed as a smooth extension of [Common Lisp](#), providing all the advantages of a rich, dynamic, reflective, and extensible programming language to the blackboard-system architects and component writers. These capabilities are crucial in building complex blackboard-based applications where object representations, knowledge sources (KSs), and control mechanisms will change during development and over the operational lifetime of the blackboard application. GBBopen is tightly integrated with CLOS (the Common Lisp Object System) and provides additional blackboard-specific object mechanisms via the [Metaobject Protocol](#).

The open-source licensing of GBBopen provides a number of important benefits:

- A modular, open-source reference implementation of blackboard-system infrastructure that serves as a basis for research and development activities.
- The availability of source code and the right to modify it enables unlimited improvement and enhancement of the software. It also makes it possible to port the code to new hardware and software, to adapt it to changing conditions, and to reach a detailed understanding of how GBBopen works. Source code availability also makes it much easier to isolate and fix bugs.
- The right to redistribute improvements and extensions to the GBBopen source code.
- The right to use the software.
- There is no single entity on which the future of the GBBopen software depends. This is particularly important given the highly specialized nature of blackboard-system software and the lack of multiple implementations.
- GBBopen supports alternative and additional GBBopen modules for use in research and experimentation.

# 1 Starting Up

GBBopen is packaged with its own module system (see page 21) that supports compiling and loading GBBopen components. The Module Manager Facility is designed for ease of use and for simplicity in porting to Common Lisp implementations. For example, to compile all GBBopen modules, you only need to evaluate the following forms within your Common Lisp environment. First load GBBopen's `<install-directory>/initiate.lisp` file:

```
cl-user> (load "<install-dir>/initiate.lisp")
;; Loading <install-dir>/initiate.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
;;   Loading <install-dir>/extended-repl.lisp
;;   Loading <install-dir>/commands.lisp
;;   Loading <install-dir>/gbbopen-modules-directory.lisp
;; No shared module command definitions were found in <install-dir>/gbbopen-modules/.
;; No personal module command definitions were found in <homedir>/gbbopen-modules/.
#P"<install-dir>/initiate.lisp"
cl-user>
```

Notice that some additional GBBopen initialization files have been loaded by this file as well as GBBopen's top level read-eval-print loop (REPL) command definitions.

## Windows users

If you are running GBBopen on Windows, note that backslash is the escape character in the standard Common Lisp reader; it causes the next character to be treated as a normal character rather than as having any special syntactic characteristics. So, each backslash in a file-name string must be entered as two backslash characters. For example:

```
> (load "c:\\GBBopen\\initiate.lisp")
```

Many Common Lisp implementations also support Unix-style regular slashes in Windows file names (e.g., "c:/GBBopen/initiate.lisp"), which can be particularly convenient when typing file names in the REPL.

## Top-level REPL commands

The files loaded by `<install-directory>/initiate.lisp` add some handy REPL keyword commands when running [Allegro CL](#), [Clozure CL](#), [CMUCL](#), [ECL](#), [LispWorks](#), [SBCL](#), and [Sciener CL](#) users. Some interaction interfaces, such as [SLIME](#), use their own REPL rather than the top-level listener provided by the Common Lisp implementation and, therefore, may not support keyword REPL command processing. GBBopen provides a Swank extension to the [SLIME](#) REPL that supports REPL keyword commands.

Built-in and GBBopen REPL commands are defined in the file `<install-directory>/commands.lisp`. REPL commands, including those that have arguments, are specified using a non-list ("spread") representation. For example:

```
> :gbbopen-test :propagate :create-dirs
...
>
```

Some Common Lisp implementations ([Clozure CL](#), [LispWorks](#), and [SBCL](#)) and the [SLIME](#) REPL interface, also support REPL commands in non-spread (list) form in addition to the spread notation. For example:

```
> (:gbbopen-test :propagate :create-dirs)
...
>
```

Equivalent functions in the `:common-lisp-user` package are always defined for each REPL command, and these functions can be used in place of REPL keyword-command processing.

### Compiling all GBBopen modules

Once `<install-dir>/initiate.lisp`, all GBBopen modules can be compiled by entering the following REPL command:

```
cl-user> :compile-gbbopen
;; Loading <install-dir>/startup.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
;; Loading <install-dir>/source/module-manager/module-manager-loader.lisp
;; Loading <install-dir>/<platform-dir>/module-manager/module-manager.lisp
...
;; Loading <install-dir>/modules.lisp
;; No shared module definitions were found in <install-dir>/gbbopen-modules/.
;; No personal module definitions were found in <homedir>/gbbopen-modules/.
...
;;; GBBopen modules compilation completed.
[Common Lisp will exit]
```

GBBopen should compile all GBBopen modules and then exit Common Lisp without error.

As can be seen from the file-loading messages, the `startup.lisp` file that is loaded by the `:compile-gbbopen` command loads a bootstrap loader file for the Module Manager Facility (see [page 21](#)) (the file `source/module-manager/module-manager-loader.lisp`). This bootstrap file then loads the Module Manager files (`source/module-manager/module-manager.lisp` and `source/module-manager/module-manager-user.lisp`) followed by the module definitions for all GBBopen modules (contained in the file `source/modules.lisp`). Then the Module Manager is used to compile all GBBopen modules.

## ASDF, clbuild, and Quicklisp users

GBBopen's Module Manager Facility provides an interface that allows [ASDF](#) (and therefore [clbuild](#) and [Quicklisp](#)) to play nice with Module Manager. If you installed GBBopen using clbuild or Quicklisp, ASDF has been informed of GBBopen's `<install-dir>/gbbopen.asd` system-definition file. Otherwise, to use ASDF to set up GBBopen, you must add the `gbbopen.asd` file to ASDF's Registry manually. Then, instead of loading the `<install-dir>/initiate.lisp` file, the Module Manager and GBBopen module definitions can be loaded using ASDF by entering:

```
cl-user> (asdf:operate 'asdf:load-op :gbbopen)
;; Loading <install-dir>/initiate.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
...
;; Loading <install-dir>/startup.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
;; Loading <install-dir>/source/module-manager/module-manager-loader.lisp
;; Loading <install-dir>/<platform-dir>/module-manager/module-manager.lisp
...
;; Loading <install-dir>/modules.lisp
;; No shared module definitions were found in
<install-dir>/gbbopen-modules/.
;; No personal module definitions were found in <homedir>/gbbopen-modules/.
...
;; Defining an ASDF defsystem for each Module Manager module...
cl-user>
```

or when ASDF is integrated with Common Lisp's **require**:

```
cl-user> (require :gbbopen)
;; Loading <install-dir>/initiate.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
...
;; Loading <install-dir>/startup.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
;; Loading <install-dir>/source/module-manager/module-manager-loader.lisp
;; Loading <install-dir>/<platform-dir>/module-manager/module-manager.lisp
...
;; Loading <install-dir>/modules.lisp
;; No shared module definitions were found in
<install-dir>/gbbopen-modules/.
;; No personal module definitions were found in <homedir>/gbbopen-modules/.
...
;; Defining an ASDF defsystem for each Module Manager module...
cl-user>
```

Notice that loading the `<install-dir>/initiate.lisp` file loaded only GBBopen's REPL command processing extensions, global REPL command definitions, and module-directory processing into Common Lisp—the Module Manager is not loaded until it is needed (such as when we performed the `:gbbopen-user` REPL command). The ASDF `:gbbopen` “system” start up, on the other hand, must also load the Module Manager and module definitions, as they are required in order to define an ASDF system for each Module Manager module.

## Personal `gbbopen-init.lisp` file

If a `gbbopen-init.lisp` file (source or compiled) is present in the user's "home" directory (as defined by **user-homedir-pathname**), it is loaded by the `<install-directory>/startup.lisp` file after the Module Manager Facility (see page 21) and definitions have been loaded. A personal `<homedir>/gbbopen-init.lisp` file is a handy mechanism for defining user-specific modules, application modules, GBBopen parameters, and other personalizations.

Here is a simple example of a personal `<homedir>/gbbopen-init.lisp` file that defines a root directory named `:my-app-root` and the module `:my-app`:

```
;;; -*- Mode:Common-Lisp; Package:CL-USER -*-

(in-package :cl-user)

(module-manager:define-root-directory :my-app-root
  (make-pathname :directory "~/my-app"))

(module-manager:define-module :my-app
  (:requires :gbbopen-user)
  (:directory :my-app-root)
  (:files "my-file"))

;;; =====
;;; End of File
;;; =====
```

For shared or more substantial application modules, we recommend a packaging convention that mirrors that of GBBopen. This will be discussed shortly in conjunction with using a personal `gbbopen-modules` directory (see page 7).

## Personal `gbbopen-commands.lisp` file

You can create your own REPL commands by defining them in a personal `gbbopen-commands.lisp` file. If a `gbbopen-commands` file (source or compiled) is present in the user's "homedir" home directory (as defined by **user-homedir-pathname**), it is loaded automatically by GBBopen's `initiate.lisp` file. For example, the following personal `gbbopen-commands.lisp` file defines a REPL command (named `:my-app`) and an equivalent function (`cl-user::my-app`) for compiling and loading the `:my-app` module that was defined above:

```
;;; -*- Mode:Common-Lisp; Package:CL-USER -*-

(in-package :cl-user)

(define-repl-command :my-app (&rest options)
  "Compile and load my GBBopen application module"
  (startup-module :my-app options :gbbopen-user))

;;; =====
;;; End of File
;;; =====
```

## Personal gbbopen-modules directory

Although a personal `gbbopen-init.lisp` file can be used to define the module `:my-app`, GBBopen provides an alternative mechanism that is even more convenient if you develop, share, or use a number of modules or applications.

If a `gbbopen-modules` directory is present in the user's home directory (as defined by `user-homedir-pathname`), it is expected to consist of directories each containing an individual GBBopen application or library. Although these application directories can be placed directly in the `gbbopen-modules` directory, it is generally more convenient to use a symbolic link (or a "pseudo symbolic-link file" on Windows) to point to the actual application directory, where ever it is located. For example, an application can be provided to a number of users by creating a symbolic link to the actual application directory in each user's `gbbopen-modules` directory.

Each application directory contains:

- a `modules.lisp` file that contains module definitions (loaded after the personal `gbbopen-init.lisp` file if there is one in the user's "homedir")
- a directory named `source` containing all the source files for the module or application
- an optional `commands.lisp` file that specifies REPL commands for the module (loaded after the personal `gbbopen-commands.lisp` file if there is one in the user's "homedir")
- any additional directories or files useful to the application

We highly recommend following this packaging convention, which mirrors that of GBBopen itself. It is very easy to create, use, and share modules defined in this way by placing symbolic links to the module directories in your personal `gbbopen-modules` directory. Windows, unfortunately, is the exception to this as Windows does not provide symbolic links. GBBopen users running on Windows must create a text file with the file extension `.sym` (that contains the target directory path as its sole line) as a stand-in for the symbolic link.

## Installation-wide shared-gbbopen-modules directory

There is also an `<install-directory>/shared-gbbopen-modules` directory. As with a user's `gbbopen-modules` directory (discussed above), the `shared-gbbopen-modules` directory is assumed to contain symbolic links (or "pseudo-symbolic-link" files on Windows) to individual GBBopen module directory trees.

This is the recommended mechanism for installation-wide managing and sharing of modules and applications.

## GBBopen Hyperdoc

Convenient access to a local copy of the GBBopen Hyperdoc manual from Common Lisp is available by using the **browse-hyperdoc** function; part of the `:os-interface` (see page 317) module. The browser used by **browse-hyperdoc** is specified by the value of `*preferred-browser*`. A different value can be specified in either your Common Lisp initialization file or, preferably, in your personal `gbbopen-init.lisp` file. Changing the default setting in GBBopen's `startup.lisp` is not recommended.

Emacs access to the GBBopen Hyperdoc is provided by

`<install-directory>/browse-hyperdoc.el`. This file defines the interactive Emacs command `browse-hyperdoc` and binds it to `META-?`. To enable this command, load `<install-directory>/browse-hyperdoc.el` from your `.emacs` initialization file.

If you already use the `hyperspec.el` utility (included with **SLIME** and **ILISP** distributions, but

usable on its own), the Emacs `browse-hyperdoc` command will automatically defer to the [Common Lisp HyperSpec](#) when given a non-GBBopen entity. You can also download and install a local copy of the Common Lisp HyperSpec for use without a network connection. In this case, set the value of `common-lisp-hyperspec-root` in your `.emacs` initialization file to point to your local copy of the HyperSpec. For example:

```
(setf common-lisp-hyperspec-root "file:/usr/local/CLHS/")
```

Highly recommended!

### **Starting-up entities**

Descriptions of entities related to installing and customizing GBBopen follow.

---

**\*ignored-gbbopen-modules-directory-subdirectories\***

---

[Variable]

### **Purpose**

Specify subdirectory names to be ignored by GBBopen's `gbbopen-modules` directory processing.

**Package** `:common-lisp-user`

**Module** Defined in `gbbopen-modules-directory.lisp`

**Value type** A list

**Initial value** `(".svn")`

### **Description**

Subdirectories named in `*ignored-gbbopen-modules-directory-subdirectories*` are ignored when processing shared and personal `gbbopen-modules` directories for command and module definitions.

### **Example**

Add `"CVS"` to the list of subdirectories that are ignored by GBBopen's `gbbopen-modules` directory processing:

```
> (push "CVS" *ignored-gbbopen-modules-directory-subdirectories*)  
("CVS" ".svn")  
>
```

---

**\*gbbopen-modules-directory-verbose\***

[*Variable*]

---

**Purpose**

Controls whether the processing of individual modules is shown during `gbbopen-modules` directory processing.

**Package** `:common-lisp-user`

**Module** Defined in `gbbopen-modules-directory.lisp`

**Value type** A generalized boolean

**Initial value** `t`

---

## Purpose

Specify the preferred browser program.

**Package** :common-lisp-user

**Module** Defined in `startup.lisp`

**Value type** A string

**Initial value** (see the first example below)

## Description

To change the preferred browser, set the value of `*preferred-browser*` in either your Common Lisp initialization file or your personal `gbbopen-init.lisp` file. Because `startup.lisp` is under [Subversion](#) source control, changing `startup.lisp` directly is not recommended.

## See also

[browse-hyperdoc](#) (page [318](#))

## Examples

Here is the setting that is made in `startup.lisp`:

```
(defvar *preferred-browser*
  ;; On Mac OSX we defer to the OS default browser:
  #+(or macosx darwin)
  "open"
  ;; LispWorks (non-Windows) and SBCL do not search PATH for programs, so
  ;; the path must be explicitly included in the preferred browser
  setting:
  #+(or (and lispworks (not win32)) sbcl) "/usr/bin/firefox"
  #-(or macosx darwin (and lispworks (not win32)) sbcl) "firefox")
```

Specify a different browser (in a personal `gbbopen-init.lisp` file) on Linux machines:

```
(in-package :common-lisp-user)

#+linux
(setf *preferred-browser*
  ;; Lispworks (non-Windows) and SBCL do not search PATH for programs, so
  ;; the path must be explicitly included in the preferred browser setting:
  #+(or lispworks sbcl) "/usr/bin/opera"
  #-(or lispworks sbcl) "opera")
```

## Note

[LispWorks](#) (non-Windows platforms) and [SBCL](#) do not perform a `PATH` search for programs, so the browser-program path must be explicitly included in the preferred browser setting.

---

---

**\*sym-file-verbose\***

[Variable]

---

## Purpose

Controls whether the mapping from \*.sym pseudo-symbolic-link files to target module directories is shown during `gbbopen-modules` directory processing.

**Package** :common-lisp-user

**Module** Defined in `gbbopen-modules-directory.lisp`

**Value type** A generalized boolean

**Initial value** nil

## Example

Show \*.sym pseudo-symbolic-link file to target module-directory mapping `gbbopen-modules` directory processing on startup module loading (after `<install-directory>/initiate.lisp` has been loaded):

```
> (setf *sym-file-verbose* 't)
t
> :startup
;; Loading <install-dir>/startup.lisp
;; GBBopen is installed in <install-dir>
;; Your "home" directory is <homedir>
;; Loading <install-dir>/source/module-manager/module-manager-loader.lisp
;; Loading <install-dir>/source/module-manager/module-manager.lisp
;; Loading <install-dir>/source/module-manager/module-manager-user.lisp
;; Loading <install-dir>/source/modules.lisp
;; No shared module definitions were found in
<install-dir>/shared-gbbopen-modules/.
;; Loading personal module definitions from <homedir>/gbbopen-modules/...
;; Pseudo (*.sym) link <homedir>/gbbopen-modules/an-app.sym -->
/usr/local/an-app/
;; Loading /usr/local/an-app/modules.lisp
T
>
>
```

---

---

**define-repl-command** *command-name-spec lambda-list [declaration\* | documentation]* [Macro]  
*form\**

---

## Purpose

Define a top-level REPL (read-eval-print loop) command.

**Package** :common-lisp-user (also imported into and exported from :module-manager)

**Module** Defined in `extended-repl.lisp`

## Arguments

*command-name-spec* A *command-name* or a list (*command-name option\**)  
*lambda-list* A lambda-list  
*declaration* A declare expression (not evaluated)  
*documentation* A documentation string (not evaluated)  
*form* A form

## Detailed syntax

*option ::=* :add-to-native-help | :no-help | :no-cl-user-function

## Terms

*command-name* A keyword symbol naming the command

## Description

The arguments to the command are not evaluated before the command is invoked; it is up to the command to perform argument evaluation if needed (see the example, below).

If the `:add-to-native-help` option is specified, then the command and its *documentation* string are added to the Common Lisp implementation's primary REPL help; otherwise the command is only added to the extended-REPL commands help that is displayed by the `:commands` REPL command. (Not all Common Lisp implementations distinguish primary and secondary command-help levels.)

If the `:no-help` option is specified, then the command is not added to either the primary or secondary help displays.

An equivalent function in the `:common-lisp-user` package is normally defined for the *command-name* keyword command, and this function can be used when REPL keyword-command processing is not fully supported. However, a `:common-lisp-user` functional version of the command is not defined if the `:no-cl-user-function` option is specified.

*Documentation* is a documentation string to be associated with the REPL command *command-name*.

## See also

[startup-module](#) (page 16)

## Examples

Define a REPL command named `:ds` to be a handy shortcut to the Common Lisp `describe` function:

```
(define-repl-command (:ds :add-to-native-help) (obj)
  "Describe object"
  (describe (eval obj)))
```

Define a REPL command named `:my-app` that compiles and loads the module `:my-app` and sets the current package to the `:gbbopen-user` package:

```
(define-repl-command :my-app (&rest options)
  "Compile and load my GBBopen application module"
  (startup-module :my-app options :gbbopen-user))
```

---

## define-repl-command

---

**funcall-in-package** *symbol package-name* &rest *args*

---

[Function]

## Purpose

Apply a function to arguments when the package containing the function may not exist until execution time.

**Package** :common-lisp-user (not exported)

**Module** Defined in `initiate.lisp` (or in `startup.lisp`, if `initiate.lisp` is not used to initiate GBBopen)

## Arguments

*symbol* A symbol  
*package-name* A package name  
*args* Arguments to the function

## Description

This function provides a convenient means of applying a function to arguments, when the package containing the function may not exist until execution time. The function to be applied is determined at runtime by using the name of *symbol* to find the symbol with the same name in *package* and using it as the function designator.

## Example

Define a REPL command named `:my-app` that compiles and loads the module `:my-app`, sets the current package to the `:gbbopen-user` package, and then calls the function `startup` in the package `:my-app-package` that is defined when the `:my-app` module is loaded:

```
(define-repl-command :my-app (&rest options)
  "Compile and load my GBBopen application module"
  (startup-module :my-app options :gbbopen-user)
  ;; Call the startup function:
  (funcall-in-package '#:startup :my-app-package))
```

## Purpose

Compile and load a GBBopen module, even if the Module Manager Facility (see page 21) is not yet loaded, and optionally set the current package.

**Package** :common-lisp-user (not exported)

**Module** Defined in `initiate.lisp`

## Arguments

*module-name* A keyword symbol naming a module

*option* Any of the following keywords:

:create-dirs	Creates any needed directories that are missing in the compiled-file tree
:noautorun	Binds <b>*autorun-modules*</b> to <code>nil</code> during compilation and loading
:nopatches	Do not compile or load any patches
:nopropagate	Cancels (overrides) a specified <code>:propagate</code> option
:patches-only	Do not compile or load/reload any non-patch files (binds <b>*patches-only*</b> to <code>t</code> during compilation and loading)
:print	Incrementally prints information during compilation and loading
:propagate	Applies the specified options to all required modules
:recompile	Compiles files even if the existing compiled file is newer than the source file
:reload	Loads files even if they are already loaded
:source	Loads from the source file even if the existing compiled file is newer than the source file (implies <code>:reload</code> )

*package-name* A package name (default is `nil`)

## Errors

Module *module-name* has not been defined.

A relative directory specification contains a circularity.

## Description

This function bootstraps GBBopen loading, if needed, before calling **compile-module** on *module-name* with *options*. Then, unless *package-name* is `nil`, the current package is set to the package named by *package-name*. The named package does not need to be defined before calling **startup-module**, but it must be defined at the conclusion of module compilation and loading.

**Startup-module** adds the option `:propagate` to the supplied *options*. If this propagation behavior is not desired, the `:nopropagate` option can be specified to override (cancel) propagation.

## See also

**compile-module** (page 26)

**define-module** (page 30)

**define-repl-command** (page 13)

## Example

Define a REPL command named `:my-app` that compiles and loads the module `:my-app` and sets the current package to the `:gbbopen-user` package:

```
(define-repl-command :my-app (&rest options)
  "Compile and load my GBBopen application module"
  (startup-module :my-app options :gbbopen-user))
```

---

**startup-module**

---

**with-system-name** (*system-name*) *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Associate *system-name* with REPL commands, directory definitions, and module definitions defined in *forms*.

**Package** :common-lisp-user (also imported into and exported from :module-manager)

**Module** Defined in `extended-repl.lisp`

## Arguments

*system-name* A keyword symbol identifying a system

*form* A form

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**define-relative-directory** (page [33](#))

**define-root-directory** (page [35](#))

**define-module** (page [30](#))

**define-repl-command** (page [13](#))

## Examples

Define a REPL command named `:my-app` associated with system `:my-app` that compiles and loads the module `:my-app` and sets the current package to the `:gbbopen-user` package:

```
(with-system-name (:my-app)
  (define-repl-command :my-app (&rest options)
    "Compile and load my GBBopen application module"
    (startup-module :my-app options :gbbopen-user)))
```

Now, show the commands associated with system `:my-app`:

```
> :commands :my-app
Command          Description
-----          -
:my-app          Compile and load my GBBopen application module
>
```

Now, undefine all the commands, directories, and module definitions associated with system `:my-app`:

```
> :undefine-system :my-app
Really undefine commands, directories, & modules of :my-app? y
;; System :my-app undefined.
> :commands :my-app
;; System :my-app was not found.
>
```

## Notes

A developer will typically wrap the **define-repl-command** forms in an application's `commands.lisp` file with a single **with-system-name** macro and the definitions in the application's `modules.lisp` file with a second **with-system-name** macro.

---

**with-system-name**

## 2 Module Manager Facility

The Module Manager Facility provides a lightweight and easy to use mechanism for compiling and loading module files. The facility keeps track of the dependencies between modules and the modules that have been compiled and loaded. The Module Manager Facility was designed to be easy to use, yet it is powerful enough to manage substantial software projects, each operating on multiple hardware platforms and Common Lisp implementations. Other, more complex, **defsystem** packages, such as ([ASDF](#)), are available, but their complexity makes defining and maintaining correct system definitions difficult.

The `:module-manager` module is automatically loaded by the GBBopen `<install-directory>/startup.lisp` file (by the `module-manager-loader.lisp` file located in the `module-manager` subdirectory). If a `gbbopen-init.lisp` file (source or compiled) is present in the user's "home" directory, it is loaded immediately following the loading of the Module Manager Facility. A personal `<homedir>/gbbopen-init.lisp` file is very useful for defining GBBopen parameters and other personalizations (see Section 1).

### Key concepts

The Module Manager Facility incorporates several important concepts:

- Dependencies are maintained among modules, rather than among individual files. Defining compilation and loading dependencies at the file level (and maintaining those dependencies as applications and libraries evolve) is both complex and error prone. Instead, each Module Manager module definition specifies a total ordering of any other modules that it requires (directly) as well as a total ordering of the individual files that comprise the module. (It is an error for a file to be associated with more than one module.)
- A total ordering of all the individual files that are required and used by a module is generated from the module definitions. The Module Manager Facility expands a module's specified required modules recursively to obtain a fully expanded sequence of all the modules that are required (directly or indirectly) by the module. The individual files associated with each module in this fully expanded sequence of required modules define the sequence of all the individual files that must be possibly compiled and/or loaded as part of compiling or loading the module.
- Recompilation and reloading dependencies are specified as options associated with individual files. For example, if the option `:forces-recompile` is specified for a file and that file needs to be recompiled, all files later in the total file sequence need to be recompiled and reloaded. This simple, "somewhat aggressive" recompilation mechanism replaces complex definitions of pairwise dependencies between individual files (and the risk of missed and no-longer-appropriate dependencies), but at the cost of some unneeded recompilation. It also simplifies handling dependencies that exist between some files in a requiring module and files in ones of that module's required modules when each module is supported by a different developer/maintainer. A developer only needs to consider whether a file includes forms (such as macro definitions and compiler transforms) that may effect the compilation and/or loading of downstream files (whether or not those files are known to the developer). With today's fast Common Lisp compilers, some unnecessary recompilation is a small price to pay for easier and more likely to be correct dependency specifications.
- The fully expanded required module sequences of all modules (and therefore the compilation and loading sequence of files for all modules) must be consistent. This requirement is checked by the Module Manager and ensures that the ordering of file compilation and loading will be maintained no matter what module (or modules) is being loaded. Ordering consistency is important in avoiding unnecessary recompilation of unchanged files if different modules were allowed to specify their sequence of overlapping required modules differently. Although

required-module ordering consistency is a very strong constraint—especially when independently development modules use common libraries as required modules—in practice, existing required-module orderings quickly eliminate most “otherwise arbitrary” required-module orderings. Where two required modules are not constrained as to their pairwise ordering, the convention of specifying the module that is earlier alphabetically first is recommended.

- Separate compiled-file directory trees are created for each Common Lisp implementation and platform. These compiled-file directories mirror the directory structure of the original source-file directory tree of a system. This separation makes packaging and distributing compiled files for one or more platforms (with or without the source tree) simple by including only the desired directory trees.
- Freezing a release (and providing patches later, if needed) are important phases of the release life cycle of some applications. Support for freezing and patches that are in keeping with the above concepts is provided explicitly by Module Manager operators.

### Stand-alone usage

To bootstrap the Module Manager Facility stand-alone (separate from the GBBopen Project software tree), do the following:

- create a “root” directory to contain the Module Manager software tree  
(for example: `$ mkdir my-tree`)
- create the Module Manager portion of the source tree in the newly created “root” directory  
(for example: `$ cd my-tree ; mkdir -p source/module-manager`)
- copy the `module-manager-loader.lisp`, `module-manager.lisp`, `module-manager-user.lisp` files into the `source/module-manager` directory
- start your Common Lisp implementation and then load the `module-manager-loader.lisp` file  
    `> (load "my-tree/source/module-manager/module-manager-loader")`
- compile the `:module-manager` and `:module-manager-user` modules:  
    `> (module-manager:compile-module :module-manager-user :create-dirs :propagate)`

After performing the above steps, the Module Manager can be used stand-alone by loading `source/module-manager-loader.lisp` as part of your Common Lisp initialization.

### Module Manager entities

Descriptions of Module Manager entities follow.

---

**\*automatically-create-missing-directories\***

[Variable]

---

## Purpose

Controls whether any directories that are missing in the compiled-file tree should be created when needed.

**Package** :common-lisp-user (also imported into and exported from :module-manager)

**Module** :module-manager

**Value type** A generalized boolean

**Initial value** t

## Description

By default, the Module Manager will create any needed directories in the compiled-file tree automatically during module compilation. For tighter control over new directory creation, **\*automatically-create-missing-directories\*** can be set to `nil`, causing **compile-module** to signal a continuable error during compilation if a needed directory is missing in the compiled-file tree. When **\*automatically-create-missing-directories\*** has been set to `nil`, the **compile-module** option `:create-dirs` provides a convenient way to bind **\*automatically-create-missing-directories\*** to `true` during compilation of a specified module.

## See also

**compile-module** (page [26](#))

## Example

Have the Module Manager generate a continuable error during module compilation when a needed directory in the compiled-file tree is missing (and the `compile-module` option `:create-dirs` was not specified when compiling the module needing that missing directory):

```
(setf common-lisp-user::*automatically-create-missing-directories* nil)
```

---

---

**\*autorun-modules\***

[Variable]

---

## Purpose

Indicates whether a module should evaluate autorun forms when it is loaded.

**Package** :common-lisp-user (also imported into and exported from :module-manager)

**Module** :module-manager

**Value type** A generalized boolean

**Initial value** True

## Description

The value of **\*autorun-modules\*** can be used to conditionally evaluate forms when module files are loaded. By default, the value of **\*autorun-modules\*** is set to true, but it can be set or bound to nil to disable conditional autorun forms. The compile-module or load-module option :noautorun can also be specified to bind **\*autorun-modules\*** to nil during module compilation and loading.

## See also

**compile-module** (page [26](#))

**load-module** (page [47](#))

**load-module-file** (page [49](#))

## Example

Conditionally evaluate the http-test function when the file http-test.lisp that includes the following form is loaded:

```
(when common-lisp-user::*autorun-modules*  
  (http-test "GBBopen.org" 80))
```

---

**\*patches-only\***

[Variable]

---

## Purpose

Controls whether regular files (non-patch files) in modules are compiled and loaded by the Module Manager.

**Package** :common-lisp-user (also imported into and exported from :module-manager)

**Module** :module-manager

**Value type** A generalized boolean

**Initial value** nil

## Description

By default, **\*patches-only\*** is set to `nil`, but it can be set to `true` to instruct **compile-module** and **load-module** to bypass compiling and loading regular files (non-patch files) in modules. By setting **\*patches-only\*** to `true` after loading an application, the image is “frozen” so that only patches will be applied by subsequent uses of **compile-module** or **load-module**.

## See also

**compile-module** (page [26](#))

**load-module** (page [47](#))

## Example

Compile, load, and freeze the GBBopen application defined by module `:my-app`:

```
> (progn (compile-module :my-app :propagate)
        (setf *patches-only* 't))
t
>
```

## Purpose

Compiles and loads the files in a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*option* Any of the following keywords:

:create-dirs	Creates any needed directories that are missing in the compiled-file tree
:noautorun	Binds <b>*autorun-modules*</b> to nil during compilation and loading
:nopatches	Do not compile or load any patches
:nopropagate	Cancels (overrides) a specified :propagate option
:patches-only	Do not compile or load/reload any non-patch files (binds <b>*patches-only*</b> to t during compilation and loading)
:print	Incrementally prints information during compilation and loading
:propagate	Applies the specified options to all required modules
:recompile	Compiles files even if the existing compiled file is newer than the source file
:reload	Loads files even if they are already loaded
:source	Loads from the source file even if the existing compiled file is newer than the source file (implies :reload)

## Errors

Module *module-name* has not been defined.

A relative directory specification contains a circularity.

Module *module-name* or one of its required modules has not been loaded and **\*patches-only\*** is true.

## Description

These file options, when specified for individual files in the module definition (see [define-module](#)), have the following effects (overriding the behavior of *options* supplied to **compile-module**):

:developing	If the patch file has changed, recompile and reload it (patch files only)
:forces-recompile	If the file has changed, recompile and reload all subsequent files and modules
:noload	Compile, but do not load the file
:recompile	Always recompile the file
:reload	Always reload the file
:skip-recompile	Skip recompiling the file if it has been loaded already (takes precedence over other recompilation decisions)
:source	Do not compile the file (load the source instead)

## See also

<b>:disable-compiler-macros</b>	(page <a href="#">62</a> )
<b>:full-safety</b>	(page <a href="#">63</a> )
<b>*automatically-create-missing-directories*</b>	(page <a href="#">23</a> )
<b>*autorun-modules*</b>	(page <a href="#">24</a> )
<b>*patches-only*</b>	(page <a href="#">25</a> )

<b>load-module</b>	(page <a href="#">47</a> )
<b>load-module-file</b>	(page <a href="#">49</a> )
<b>startup-module</b>	(page <a href="#">16</a> )

## Example

Compile and load the GBBopen User module and all its required modules, creating new compilation directories if they do not exist already:

```
(compile-module :gbbopen-user :propagate :create-dirs)
```

## REPL Note

**Compile-module** can be invoked using the REPL command:

```
:cm [module-name [option*]]
```

which remembers the last specified *module-name* and *options* as default values for the command.

---

**compile-module**

---

## Purpose

Continue the definition of a multiple top-level form patch to a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*form* A form

## Errors

A patch has not been started with **start-patch**.

## Description

The **continue-patch** macro, along with **start-patch** and **finish-patch**, can be used to define a patch as multiple top-level forms in the same patch file if a patch cannot be defined as a single **patch** form.

## See also

**allow-redefinition** (page [65](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**describe-patches** (page [39](#))  
**finish-patch** (page [40](#))  
**get-patch-description** (page [44](#))  
**parse-date** (page [181](#))  
**patch** (page [53](#))  
**patch-loaded-p** (page [55](#))  
**start-patch** (page [57](#))  
**undefmethod** (page [128](#))

## Example

Define a more complex patch (in a file named `my-app-p002.lisp` in the `patches` subdirectory of the module):

```
(start-patch (2 "06-23-08"
              :author "Corkill"
              :description "A more complex patch example")
  (printv "More complex example patch started!"))

(eval-when (:compile-toplevel)
  (continue-patch
    (printv "Defining compile-time-only-macro-for-patch...")
    (defmacro compile-time-only-macro-for-patch (x)
      ` , x)))

(eval-when (:compile-toplevel :load-toplevel :execute)
```

```
(continue-patch
 (printv "Defining macro-for-patch at compile & load time...")
 (defmacro macro-for-patch (x)
  `',x))

(continue-patch
 (printv "Using macro-for-patch at load time...")
 (macro-for-patch abc))

(eval-when (:compile-toplevel :load-toplevel :execute)
 (continue-patch
  (printv "Using macro-for-patch at compile & load time...")
  (macro-for-patch xyz)))

(eval-when (:compile-toplevel)
 (continue-patch
  (printv "Using compile-time-only-macro-for-patch...")
  (compile-time-only-macro-for-patch abc)))

(finish-patch
 (printv "More complex example patch finished!"))
```

---

**define-module** *module-name* [*documentation*] *module-option*\*

---

[*Macro*]

## Purpose

Defines a module to the Module Manager Facility.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*documentation* A documentation string (not evaluated)

*module-options* See below

## Errors

The `:requires` module option specifies a fully expanded required-module order that contains a circularity.

The `:requires` module option specifies a fully expanded required-module order that conflicts with the fully expanded required-module order in a previously defined module.

## Detailed syntax

```
module-option ::= (:requires module-name*) |  
                  (:directory directory-specifier) |  
                  (:files file-specifier*) |  
                  (:patches file-specifier*)
```

```
directory-specifier ::= root-or-relative-directory subdirectory*
```

```
file-specifier ::= file-name |  
                  (file-name file-option*)
```

```
file-option ::= :recompile | :reload | :source | :forces-recompile | :noload
```

## Terms

*root-or-relative-directory* A keyword naming a root or relative directory, a keyword naming another module, or `nil`, indicating that the module is rooted at the `*load-truename*` value in effect when the module definition is loaded

*subdirectory* A string naming a subdirectory

*file-name* A string naming a file

*module-name* A keyword symbol naming a module

## Description

The *module-options* `:requires`, `:directory`, `:files`, and `:patches` can be specified in any order, but at most one of each is allowed.

If a `:directory` module option is not specified, an implicit root directory for the module (at the `*load-truename*` of the file containing the **define-module** form) is used. If the `:directory` module option specifies a keyword naming another module, the directory specification of the named module is used as the base (root or relative) directory for the module that is being defined. If both a module and a root or relative directory definition have the same name, the directory definition takes precedence over the module directory specification.

The `:requires` module option specifies, in order, the modules that must be loaded before this module. The fully expanded required-module order determined from the specified `:requires` module option must be consistent with all previously defined modules.

The `:files` module option specifies, in order, the files that are compiled (when appropriate) and loaded for this module. Similarly, the `:patches` module option specifies, in order, the patch files that are compiled (when appropriate) and loaded for this module. The combination of the `:requires`, `:files`, and `:patches` module options specifies a total ordering of all the files that must be compiled and loaded for this module (the files associated with each of the required modules followed by the files specified for this module followed by the patch files associated with each of the required modules followed by the patch files specified for this module). In order to maintain an invariant patch ordering, patches should be added sequentially to the main (last loaded) module of an application. The source files for patches should be placed in a subdirectory named `patches` in the module's source-file directory.

*File-options* have the following effects:

<code>:developing</code>	If the patch file has changed, recompile and reload it (patch files only)
<code>:forces-recompile</code>	If the file has changed, recompile and reload all subsequent files and modules
<code>:noload</code>	Compile, but do not load the file
<code>:recompile</code>	Always recompile the file
<code>:reload</code>	Always reload the file
<code>:skip-recompile</code>	Skip recompiling the file if it has been loaded already (takes precedence over other recompilation decisions)
<code>:source</code>	Do not compile the file (load the source instead)

The *documentation* string associated with a module can be accessed and set by using Common Lisp's `documentation` generic function with the module's *module-name* and the *doc-type* module.

## See also

<b>with-module-redefinitions</b>	(page <a href="#">59</a> )

## Examples

Define a root directory and module for `:my-app`:

```
(define-root-directory :my-app-root
  (make-pathname :directory "~/my-app"))
```

```
(define-module :my-app
  "My simple application module"
  (:requires :gbbopen-user)
  (:directory :my-app-root)
  (:files "preamble"
          ("macros" :forces-recompile)
          "classes"
          "my-app"
          "epilogue"))
```

Define a module for `:my-app` rooted relative to the file containing the **define-module** form:

```
(define-module :my-app
  "My simple application module"
  (:requires :gbbopen-user)
  (:files "preamble"
          ("macros" :forces-recompile)
          "classes"
          "my-app"
          "epilogue"))
```

Retrieve and then modify the documentation string of module `:my-app`:

```
> (documentation ' :my-app 'module)
"My simple application module"
> (setf (documentation ' :my-app 'module) "My way cool application module")
"My way cool application module"
> (documentation ' :my-app 'module)
"My way cool application module"
>
```

---

## define-module

## Purpose

Defines a directory relative to a root or relative directory or to the directory specification of a module definition.

**Package** :module-manager

**Module** :module-manager

## Arguments

*name* A keyword symbol naming the relative directory  
*directory* The keyword symbol name of a root or relative directory or the name of a module  
*subdirectories* One or more strings specifying, in order, subdirectories from *directory* to the relative directory. (The keyword `:up` or `:back` can also be supplied in addition to any of these strings, indicating to go upward one semantic or syntactic level of directory structure, respectively.)

## Description

Root and relative directory definitions are used to isolate file-system details from module definitions. A relative directory is defined in relation to another directory definition, that is either a root directory or another relative directory (which itself is eventually associated with a root directory). If this root directory location changes, every relative directory associated with it is adjusted automatically.

The *documentation* string associated with a relative directory can be accessed and set by using Common Lisp's `documentation` generic function with the directory's *name* and the *doc-type* directory.

## See also

**define-root-directory** (page [35](#))  
**get-directory** (page [42](#))  
**show-defined-directories** (page [56](#))  
**with-system-name** (page [18](#))

## Examples

Define a relative directory below `:my-app-root` named `:my-tests`:

```
(define-relative-directory :my-tests
  "The tests directory for My App"
  :my-app-root "tests")
```

Define another relative directory named `:my-performance-tests` below `:my-tests`:

```
(define-relative-directory :my-performance-tests
  "The performance-tests subdirectory for My App"
  :my-tests "performance")
```

Define a data directory sibling to the source directory of `:my-app` module:

```
(define-relative-directory :my-app-data
  "The data directory for My App"
  :my-app :up "data")
```

**Retrieve and then modify the documentation string of the relative directory named `:my-tests`:**

```
> (documentation ' :my-app-data 'directory)
"The data directory for My App"
> (setf (documentation ' :my-app-data 'directory)
      "The data directory for my way cool application")
"The data directory for my way cool application"
> (documentation ' :my-app-data 'directory)
"The data directory for my way cool application"
>
```

---

### **define-relative-directory**

## Purpose

Define a root directory.

**Package** :module-manager

**Module** :module-manager

## Arguments

*name* A keyword symbol naming the root directory or a list containing the keyword-symbol name and, optionally, an application-version-identifier string

*directory-specification* One of the following:

- A pathname specifying the root directory
- A keyword naming a previously defined root directory
- A string specifying the root directory (only if a *documentation* string is supplied; otherwise, convert the root directory string to a pathname)
- A symbol whose value is one of the above

*subdirectories* One or more strings specifying, in order, subdirectories from *directory-specification* to the root directory. (The keyword `:up` or `:back` can also be supplied in addition to any of these strings, indicating to go upward one semantic or syntactic level of directory structure, respectively.)

## Description

Root and relative directory definitions are used to isolate file-system details from module definitions. Root directories specify a fixed anchor directory for a tree of relative directory definitions. If the root directory is redefined to a new location, all relative directories beneath it are updated automatically.

Note: When a root directory is used as the *directory-specification* for a new root directory, the new root-directory location will not be changed if the location of the source root directory is changed.

When an application-version-identifier string is supplied in *name*, it is concatenated to the standard `<platform-dir>` compiled-directory name for all compiled module files that are defined relative to this root-directory.

The *documentation* string associated with a root directory can be accessed and set by using Common Lisp's `documentation` generic function with the directory's *name* and the *doc-type* `directory`.

## See also

**define-relative-directory** (page [33](#))

**get-directory** (page [42](#))

**get-root-directory** (page [46](#))

**show-defined-directories** (page [56](#))

**with-system-name** (page [18](#))

## Examples

Define a root directory named `:my-app-root`:

```
(define-root-directory :my-app-root
  "The installation directory for My App"
  (make-pathname :directory "~/my-app"))
```

Define a root directory named `:my-app-root` to be the directory containing the file containing the **define-root-directory** form:

```
(define-root-directory :my-app-root
  "The installation directory for My App"
  *load-truename*)
```

Define a root directory named `:my-app-root` to be the directory containing the file containing the **define-root-directory** form, but if the `:my-app-prerelease` feature is present, place the compiled files in a separate “beta” compile tree:

```
(define-root-directory '(:my-app-root #+my-app-prerelease "beta")
  "The installation directory for My App"
  *load-truename*)
```

Retrieve and then modify the documentation string of the root directory named `:my-app-root`:

```
> (documentation ' :my-app-root 'directory)
"The installation directory for My App"
> (setf (documentation ' :my-app-root 'directory)
  "The installation directory for my way cool application")
"The installation directory for my way cool application"
> (documentation ' :my-app-root 'directory)
"The installation directory for my way cool application"
>
```

---

## define-root-directory

## Purpose

Print information about a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

## Errors

Module *module-name* has not been defined.

A relative directory specification contains a circularity.

## Description

The description is printed to the **\*standard-output\*** stream.

Files and patch files shown with an asterisk following their load time indicate that the source file has been modified since that file was loaded.

## See also

**define-module** (page [30](#))

## Examples

Describe the `:gbbopen-test` module before it has been loaded:

```
> (describe-module :gbbopen-test)
Module :gbbopen-test (not loaded)
  The GBBopen Test module performs basic regression (trip) tests
  on the GBBopen Core entities.
  Requires: (:gbbopen-user)
  Fully expanded requires: (:module-manager :module-manager-user
                           :portable-threads :gbbopen-tools :gbbopen-core
                           :os-interface :gbbopen-user)
  Source directory: <install-dir>/source/gbbopen/test/
  Compiled directory: <install-dir>/<platform-dir>/gbbopen/test/
  Forces recompile date: None
  Files:             basic-tests (:reload)
  Patches:           basic-tests-p001
                   basic-tests-p002 (:developing)
>
```

Describe the `:gbbopen-test` module after it has been loaded:

```
> (describe-module :gbbopen-test)
Module :gbbopen-test (loaded)
  The GBBopen Test module performs basic regression (trip) tests
  on the GBBopen Core entities.
```

---

```
Requires: (:gbbopen-user)
Fully expanded requires: (:module-manager :module-manager-user
                          :portable-threads :gbbopen-tools :gbbopen-core
                          :os-interface :gbbopen-user)
Source directory: <install-dir>/source/gbbopen/test/

&gt;

---

**describe-module**

## Purpose

Print information about patch *id* to a *module*.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

## Errors

Module *module-name* has not been defined.

## See also

**continue-patch** (page [28](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**finish-patch** (page [40](#))  
**get-patch-description** (page [44](#))  
**parse-date** (page [181](#))  
**patch** (page [53](#))  
**patch-loaded-p** (page [55](#))  
**start-patch** (page [57](#))

## Examples

Display the patches to module `:my-app`:

```
> (describe-patches ':my-app)
;; 1      Jun 22, 2008 Corkill (loaded Jun 24 13:08)
;;      A simple example patch
;; 2      Jun 23, 2008 Corkill (loaded Jun 24 13:08)
;;      A more complex patch example
>
```

Display the patches to module `:gbbopen-test` (when that module has not been loaded):

```
> (describe-patches ':gbbopen-test)
;; Module :gbbopen-test is not loaded
>
```

---

## Purpose

Finish the definition of a multiple top-level form patch to a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*form* A form

## Errors

A patch has not been started with **start-patch**.

## Description

The **start-patch** macro, along with **continue-patch** and **finish-patch**, can be used to define a patch as multiple top-level forms in the same patch file if a patch cannot be defined as a single **patch** form.

## See also

<b>allow-redefinition</b>	(page <a href="#">65</a> )
<b>continue-patch</b>	(page <a href="#">28</a> )
<b>define-module</b>	(page <a href="#">30</a> )
<b>describe-module</b>	(page <a href="#">37</a> )
<b>describe-patches</b>	(page <a href="#">39</a> )
<b>get-patch-description</b>	(page <a href="#">44</a> )
<b>parse-date</b>	(page <a href="#">181</a> )
<b>patch</b>	(page <a href="#">53</a> )
<b>patch-loaded-p</b>	(page <a href="#">55</a> )
<b>start-patch</b>	(page <a href="#">57</a> )
<b>undefmethod</b>	(page <a href="#">128</a> )

## Example

Define a more complex patch (in a file named `my-app-p002.lisp` in the `patches` subdirectory of the module):

```
(start-patch (2 "06-23-08"
              :author "Corkill"
              :description "A more complex patch example")
  (printv "More complex example patch started!"))

(eval-when (:compile-toplevel)
  (continue-patch
    (printv "Defining compile-time-only-macro-for-patch...")
    (defmacro compile-time-only-macro-for-patch (x)
      `',x)))

(eval-when (:compile-toplevel :load-toplevel :execute)
```

```
(continue-patch
 (printv "Defining macro-for-patch at compile & load time...")
 (defmacro macro-for-patch (x)
  `',x))

(continue-patch
 (printv "Using macro-for-patch at load time...")
 (macro-for-patch abc))

(eval-when (:compile-toplevel :load-toplevel :execute)
 (continue-patch
  (printv "Using macro-for-patch at compile & load time...")
  (macro-for-patch xyz)))

(eval-when (:compile-toplevel)
 (continue-patch
  (printv "Using compile-time-only-macro-for-patch...")
  (compile-time-only-macro-for-patch abc)))

(finish-patch
 (printv "More complex example patch finished!"))
```

---

**finish-patch**

---

**get-directory** *name* &rest *subdirectories* ⇒ *pathname*

---

[Function]

## Purpose

Return the pathname based on a root directory, a relative directory, or a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

<i>name</i>	A keyword symbol naming a root directory, a relative directory, or a module.
<i>subdirectories</i>	One or more strings specifying, in order, subdirectories to be appended to the root directory, relative directory, or module directory. (The keyword :up or :back can also be supplied in addition to any of these strings, indicating to go upward one semantic or syntactic level of directory structure, respectively.)
<i>pathname</i>	A pathname

## Returns

The pathname.

## Errors

A relative directory specification contains a circularity.

## Description

Root and relative-directory definitions are searched first. If no *name* directory definition is found, module definitions are searched. Root directories specify a fixed anchor directory for a tree of relative directory definitions. The pathname returned for relative directories is based on the source pathname.

## See also

**define-relative-directory** (page [33](#))

**define-root-directory** (page [35](#))

**get-root-directory** (page [46](#))

**show-defined-directories** (page [56](#))

## Examples

Return the pathname of the :my-app-root root directory:

```
> (get-directory :my-app-root)
#P "~/my-app/"
>
```

Return the pathname of the :gbbopen-tools relative directory:

```
> (get-directory :gbbopen-tools)
#P "<install-dir>/source/tools/"
>
```

Return this same pathname, this time computed from the :gbbopen-root root directory:

```
> (get-directory :gbbopen-root "tools")
#P"<install-dir>/source/tools/"
>
```

**Return the pathname of the :gbbopen-user module:**

```
> (get-directory :gbbopen-user)
#P"<install-dir>/source/gbbopen/"
>
```

---

**get-patch-description** *id module-name* ⇒ *id, date, author, description, date-loaded, file-name* or *nil* [Function]

---

## Purpose

Return the information describing patch *id* to a *module*.

**Package** :module-manager

**Module** :module-manager

## Arguments

*id* An object  
*module-name* A keyword symbol naming a module  
*date* A Universal Time  
*author* A string  
*description* A string or a proper list of strings or *nil*  
*date-loaded* A Universal Time  
*file-name* A string

## Returns

Six values: *id*, *date*, *author*, *description*, *date-loaded*, and *file-name*, or *nil* if the patch has not been loaded.

## Errors

Module *module-name* has not been defined.

## See also

**continue-patch** (page [28](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**describe-patches** (page [39](#))  
**finish-patch** (page [40](#))  
**parse-date** (page [181](#))  
**patch** (page [53](#))  
**patch-loaded-p** (page [55](#))  
**start-patch** (page [57](#))

## Examples

Get the description values for patch 1 to module `:my-app`:

```
> (get-patch-description 1 ' :my-app)
1
3423139200
"Corkill"
"A simple example patch"
3423316130
"my-app-p001"
>
```

and for non-existent patch 3:

```
> (get-patch-description 3 ' :my-app)
nil
>
```

and for patch 1 in module :gbbopen-test (when that module has not been loaded):

```
> (get-patch-description 1 ' :gbbopen-test)
nil
>
```

---

**get-patch-description**

---

**get-root-directory** *name* ⇒ *pathname*

---

[Function]

## Purpose

Return the pathname of the root directory of a root directory, a relative directory, or a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*name* A keyword symbol naming a root directory, a relative directory, or a module.

*pathname* A pathname

## Returns

The root-directory pathname of the defined directory or module.

## Description

Root and relative-directory definitions are searched first. If no *name* directory definition is found, module definitions are searched. Root directories specify a fixed anchor directory for a tree of relative directory definitions.

## See also

**define-relative-directory** (page [33](#))

**define-root-directory** (page [35](#))

**get-directory** (page [42](#))

**show-defined-directories** (page [56](#))

## Examples

Return the root-directory pathname of the `:gbbopen-root` root directory:

```
> (get-root-directory :gbbopen-root)
#P"<install-dir>/"
>
```

Return the root-directory pathname of the `:gbbopen-tools` relative directory:

```
> (get-root-directory :gbbopen-tools)
#P"<install-dir>/"
>
```

Return the root-directory pathname of the `:gbbopen-user` module:

```
> (get-root-directory :gbbopen-user)
#P"<install-dir>/"
>
```

---

## Purpose

Load the files in a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*option* Any of the following keywords:

:noautorun	Binds <b>*autorun-modules*</b> to nil during loading
:nopatches	Do not load any patches
:nopropagate	Cancels (overrides) a specified :propagate option
:patches-only	Do not load/reload any non-patch files (binds <b>*patches-only*</b> to t during loading)
:print	Incrementally prints information during loading
:propagate	Applies the specified options to all required modules
:reload	Loads files even if they are already loaded
:source	Loads from the source file even if the existing compiled file is newer than the source file (implies :reload)

## Errors

Module *module-name* has not been defined.

A relative directory specification contains a circularity.

Module *module-name* or one of its required modules has not been loaded and **\*patches-only\*** is true.

## Description

These file options, when specified for individual files in the module definition (see [define-module](#)), have the following effects (overriding the behavior of *options* supplied to **load-module**):

:developing	If the compiled patch file has changed, reload it (patch files only)
:forces-recompile	If the file has changed, recompile and reload all subsequent files and modules
:noautorun	Binds <b>*autorun-modules*</b> to nil during compilation and loading
:print	Incrementally prints information during compilation and loading
:reload	Always reload the file
:source	Do not compile the file (load the source instead)

## See also

**\*autorun-modules\*** (page [24](#))

**\*patches-only\*** (page [25](#))

**compile-module** (page [26](#))

**define-module** (page [30](#))

**load-module-file** (page [49](#))

## Example

Load the GBBopen User module and all its required modules:

```
(load-module :gbbopen-user)
```

## REPL Note

**Load-module** can be invoked using the REPL command:

```
:lm [module-name [option*]]
```

which remembers the last specified *module-name* and *options* as default values for the command.

---

## load-module

---

**load-module-file** *module-name file-name* &rest *options* ⇒ *pathname*

---

[Function]

## Purpose

Load a single file from a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*file-name* A string naming a file in the module

*option* Any of the following keywords:

:noautorun Binds **\*autorun-modules\*** to nil during loading

:print Incrementally prints information during loading

:source Loads from the source file even if the existing compiled file is newer than the source file

*pathname* A pathname

## Returns

The pathname of the loaded file.

## Errors

Module *module-name* has not been defined.

File *file-name* is not associated with the module.

A relative directory specification contains a circularity.

## Description

File options specified for individual files in the module definition (see [define-module](#)) are ignored by **load-module-file**.

## See also

**\*autorun-modules\*** (page [24](#))

**define-module** (page [30](#))

**load-module** (page [47](#))

## Example

Load the source of the file `tools` from the `GBBopen Tools` module:

```
> (load-module-file :gbbopen-tools "tools" :source)
;; Loading <install-dir>/source/tools/tools.lisp
#P"<install-dir>/source/tools/tools.lisp"
>
```

**REPL Note**

**Load-module-file** can be invoked using the REPL command:

```
:lmf [module-name file-name [option*]]
```

which remembers the last specified *module-name*, *file-name*, and *options* as default values for the command.

---

**load-module-file**

---

**module-directories** *module-name* ⇒ *source-directory*, *compiled-directory*

---

[Function]

## Purpose

Return the source and compiled directories of a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*source-directory* A pathname

*compiled-directory* A pathname

## Returns

Two values: the source directory pathname and the compiled directory pathname.

## Errors

Module *module-name* has not been defined.

A relative directory specification contains a circularity.

## See also

**define-module** (page [30](#))

**load-module-file** (page [49](#))

## Example

Return the source and compiled directories of the Agenda Shell module:

```
> (module-directories :agenda-shell)
#P"<install-dir>/source/gbbopen/control-shells"
#P"<install-dir>/<platform-dir>/gbbopen/control-shells"
>
```

---

**module-loaded-p** *module-name* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a module has been fully loaded into Common Lisp.

**Package** :module-manager

**Module** :module-manager

## Arguments

*module-name* A keyword symbol naming a module

*boolean* A generalized boolean

## Returns

True if the module has been fully loaded; `nil` otherwise.

## Errors

Module *module-name* has not been defined.

## See also

**define-module** (page [30](#))

**load-module** (page [47](#))

## Example

Check if the Agenda Shell module has been loaded:

```
> (module-loaded-p :agenda-shell)
t
>
```

---

---

**patch** (*id date &key author description*) *form*\*

---

[*Macro*]

## Purpose

Define a patch to a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*id* An object

*date* A simple string representing a date (parsed by **parse-date**)

*author* A string (default is "Anonymous")

*description* A string or a proper list of strings (default is nil)

*form* A form

## Description

The source file for a patch should be placed in a subdirectory named `patches` in the module's source-files directory.

If a patch cannot be defined as a single **patch** form, the more primitive **start-patch**, **continue-patch**, and **finish-patch** macros can be used to separate the patch into multiple top-level forms in the same patch file.

## See also

**allow-redefinition** (page [65](#))  
**continue-patch** (page [28](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**describe-patches** (page [39](#))  
**finish-patch** (page [40](#))  
**get-patch-description** (page [44](#))  
**parse-date** (page [181](#))  
**patch-loaded-p** (page [55](#))  
**start-patch** (page [57](#))  
**undefmethod** (page [128](#))

## Example

Define a simple patch (in a file named `my-app-p001.lisp` in the `patches` subdirectory of the module):

```
(patch (1 "06-22-08"  
        :author "Corkill"  
        :description "A simple example patch")  
      (printv "Simple example patch loaded!"))
```

and add the patch file to the `:my-app` module:

```
(define-module :my-app
  (:requires :gbbopen-user)
  (:files "preamble"
          ("macros" :forces-recompile)
          "classes"
          "my-app"
          "epilogue")
  (:patches "my-app-p001"))
```

---

**patch**

---

**patch-loaded-p** *id module-name* ⇒ *boolean*

---

[Function]

## Purpose

Determine if patch *id* to *module* has been loaded.

**Package** :module-manager

**Module** :module-manager

## Arguments

*id* An object  
*module-name* A keyword symbol naming a module  
*boolean* A generalized boolean

## Returns

True if the patch has been loaded; `nil` otherwise.

## Errors

Module *module-name* has not been defined.

## See also

**continue-patch** (page [28](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**describe-patches** (page [39](#))  
**finish-patch** (page [40](#))  
**get-patch-description** (page [44](#))  
**parse-date** (page [181](#))  
**patch** (page [53](#))  
**start-patch** (page [57](#))

## Examples

Check if patch 1 to module `:my-app` has been loaded:

```
> (patch-loaded-p 1 ' :my-app)
t
>
```

Check for non-existent patch 3:

```
> (patch-loaded-p 3 ' :my-app)
nil
>
```

Check for patch 1 in module `:gbbopen-test` (when that module has not been loaded):

```
> (patch-loaded-p 1 ' :gbbopen-test)
nil
>
```

---

**show-defined-directories** <no arguments>

[*Function*]

---

## Purpose

Show all root and relative-directory definitions.

**Package** :module-manager

**Module** :module-manager

## See also

**define-relative-directory** (page [33](#))

**define-root-directory** (page [35](#))

**get-directory** (page [42](#))

**get-root-directory** (page [46](#))

## Example

List the currently defined root and relative directories:

```
> (show-defined-directories)
:gbopen
  Relative to :gbopen-root
  Subdirectories: ("gbopen")
:gbopen-root
  Root: <install-dir>
:gbopen-tools
  Relative to :gbopen-root
  Subdirectories: ("tools")
:module-manager-root
  Root: <install-dir>
>
```

---

---

**start-patch** (*id date* &key *author description*) *form*\*

---

[*Macro*]

## Purpose

Start the definition of a multiple top-level form patch to a module.

**Package** :module-manager

**Module** :module-manager

## Arguments

*id* An object  
*date* A simple string representing a date (parsed by **parse-date**)  
*author* A string (default is "Anonymous")  
*description* A string or a proper list of strings (default is nil)  
*form* A form

## Description

The source file for a patch should be placed in a subdirectory named `patches` in the module's source-files directory.

The **start-patch** macro, along with **continue-patch** and **finish-patch**, can be used to define a patch as multiple top-level forms in the same patch file if a patch cannot be defined as a single **patch** form.

## See also

**allow-redefinition** (page [65](#))  
**continue-patch** (page [28](#))  
**define-module** (page [30](#))  
**describe-module** (page [37](#))  
**describe-patches** (page [39](#))  
**finish-patch** (page [40](#))  
**get-patch-description** (page [44](#))  
**parse-date** (page [181](#))  
**patch** (page [53](#))  
**patch-loaded-p** (page [55](#))  
**undefmethod** (page [128](#))

## Example

Define a more complex patch (in a file named `my-app-p002.lisp` in the `patches` subdirectory of the module):

```
(start-patch (2 "06-23-08"
              :author "Corkill"
              :description "A more complex patch example")
  (printv "More complex example patch started!"))

(eval-when (:compile-toplevel)
  (continue-patch
    (printv "Defining compile-time-only-macro-for-patch..."))
```

```
(defmacro compile-time-only-macro-for-patch (x)
  `',x))

(eval-when (:compile-toplevel :load-toplevel :execute)
  (continue-patch
   (printv "Defining macro-for-patch at compile & load time...")
   (defmacro macro-for-patch (x)
     `',x)))

(continue-patch
 (printv "Using macro-for-patch at load time...")
 (macro-for-patch abc))

(eval-when (:compile-toplevel :load-toplevel :execute)
  (continue-patch
   (printv "Using macro-for-patch at compile & load time...")
   (macro-for-patch xyz)))

(eval-when (:compile-toplevel)
  (continue-patch
   (printv "Using compile-time-only-macro-for-patch...")
   (compile-time-only-macro-for-patch abc)))

(finish-patch
 (printv "More complex example patch finished!"))
```

---

**start-patch**

---

## Purpose

Defer required-module order checking of module definitions in *forms* until all *forms* have been processed.

**Package** :module-manager

**Module** :module-manager

## Arguments

*form* A form

## Errors

The fully expanded required-module order of a module redefined in *forms* conflicts with the fully expanded required-module order of another module.

## Description

Normally, the fully expanded required-module order specified by the `:requires` option is checked immediately for conflicts with previously defined modules by **define-module**. Wrapping several **define-module** forms with **with-module-redefinitions** allows the definitions to be conflicting temporarily, until all the *forms* have been processed.

## See also

**define-module** (page [30](#))

## Example

Redefine several modules with deferred conflict checking:

```
(with-module-redefinitions
  (define-module :alpha ...)
  (define-module :beta ...)
  ...
  (define-module :omega ...)))
```

## 3 GBBopen Tools

The GBBopen Tools module, `:gbbopen-tools`, contains useful Common Lisp additions and utilities. Convenient (shorthand operators (see page 143) for declared `fixnum`, `short-float`, `single-float`, `double-float`, and `long-float` numeric operators are provided, as are efficient pseudo probability (see page 149) operators. Uniform access to commonly used CLOS and MOP symbols (see page 141) is provided by the module's `:gbbopen-tools` package. Date and time parsing and formatting entities (see page 157), `fixnum`-based offset-universal-time functions (see page 197), and left-leaning red-black (LLRB) trees (see page 214) are also included in GBBopen Tools.

Additional GBBopen Tools entities that are not loaded as part of the `:gbbopen-tools` module are documented in the Additional GBBopen Tools section (see page 223) of this Reference. These additional-tool entities are grouped into separate modules that can be loaded as appropriate.

Several entities in the `:gbbopen-tools` module that are extended by additional methods in the `:gbbopen-core` module are documented in the GBBopen Core section (see page 323) of this Reference. These entities are:

```
*print-object-for-sending*
*save/send-references-only*
initialize-saved/sent-instance
make-duplicate-instance
make-duplicate-instance-changing-class
omitted-slots-for-saving/sending
print-object-for-saving/sending
print-slot-for-saving/sending
with-reading-saved/sent-objects-block
with-saving/sending-block
```

### GBBopen Tools entities

Descriptions of GBBopen Tools entities follow.

## Purpose

Disable GBBopen compiler macros.

## See also

**:full-safety** (page [63](#))

**defcm** (page [82](#))

## Example

Recompile a GBBopen application (and GBBopen itself) with all GBBopen compiler macros disabled:

```
(pushnew :disable-compiler-macros *features*)  
(compile-module :my-app :recompile :propagate)
```

---

## Purpose

Disable GBBopen compile-time optimizations.

## Description

The **:full-safety** feature disables all compile-time optimizations, including the use of compiler macros. Compiler macros can be disabled without disabling other compile-time optimizations with the feature **:disable-compiler-macros**.

## See also

**defcm** (page [82](#))

**:disable-compiler-macros** (page [62](#))

## Example

Recompile a GBBopen application (and GBBopen itself) with all GBBopen optimizations disabled:

```
(pushnew :full-safety *features*)  
(compile-module :my-app :recompile :propagate)
```

---

---

**Purpose**

Controls whether **with-error-handling** is in effect.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A generalized boolean

**Initial value** nil

**Description**

Setting **\*disable-with-error-handling\*** to true causes **with-error-handling** to evaluate its *forms* without any error handling in place. Any *handler-form* or *error-form* in the **with-error-handling** is ignored.

Setting **\*disable-with-error-handling\*** to true is very handy for debugging an unexpected error in a **with-error-handling** *form*.

**See also**

**with-error-handling** (page [132](#))

**Example**

Use **\*disable-with-error-handling\*** to debug a handled form:

```
> (with-error-handling (/ 10 0) (printv (error-message)) nil)
;; (error-message) => "Attempt to divide 10 by zero."
nil
> (setf *disable-with-error-handling* 't)
t
> (with-error-handling (/ 10 0) (printv (error-message)) nil)
Error: Attempt to divide 10 by zero.
>>
```

---

**allow-redefinition** *form*\*  $\Rightarrow$  *result*\*

[*Macro*]

---

## Purpose

Suppress redefinition warnings associated with processing *forms* when possible.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

## Arguments

*form* A form

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**continue-patch** (page [28](#))

## Example

```
> (defun redefined-function () "Silly.")
silly
> (defclass also-silly () ())
also-silly
> (allow-redefinition
   (defun redefined-function "Even more silliness.")
   (define-unit-class also-silly () ()))
also-silly
>
```

## Note

This macro is defined in the `:module-manager` module in order to make it available as early as possible.

At present, redefinition warnings are not suppressed on [CMUCL](#), [ECL](#), [SBCL](#), and [Sciener CL](#).

---

---

**assq** *item alist* ⇒ *entry*

---

[*Function*]

## Purpose

Search for *entry* in *alist* using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*alist* An association list

*entry* A cons that is an element of *alist* or `nil`

## Returns

The first cons in *alist* whose car is `eq` to *item*, or `nil` if no such cons is found.

## Description

**Assq** is a convenient shorthand for:

```
(assoc item (the list alist) :test #'eq)
```

## See also

**memq** (page [102](#))

## Examples

```
> (assq 'b '((a . 1) (b . 2) (c . 3) (b . 4)))
(b . 2)
> (assq 'x '((a . 1) (b . 2) (c . 3) (b . 4)))
nil
>
```

## Purpose

Return a numeric value that is bounded between a minimum and maximum value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*min* A number (the minimum bound)  
*number* A number  
*max* A number (the maximum bound)  
*bounded-number* A number

## Returns

One of the following values:

- *number* if it between *min* and *max*, inclusive
- *min* if *number* is less than *min*
- *max* if *number* is greater than *max*

## Examples

```
> (bounded-value 3 pi 4)
3.141592653589793d0
> (bounded-value 3.5 pi 4)
3.5
> (bounded-value 2 pi 3)
3
>
```

## Note

Declared numeric (see page [143](#)) and pseudo probability (see page [149](#)) versions of **bounded-value** are also provided: **bounded-value&**, **bounded-value\$&**, **bounded-value\$**, **bounded-value\$\$**, **bounded-value\$\$\$**, and **bounded-value%**.

---

---

**case-using** *test* *keyform* {*normal-clause*}\* [*otherwise-clause*] ⇒ *result*\* or *nil*

---

[*Macro*]

## Purpose

Conditionally execute the forms in a clause that is selected by matching the result of evaluating *keyform* according to *test*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*test* A symbol designating a comparison predicate (not evaluated)

*keyform* A form; evaluated to produce a *test-key* (see below)

*results* The values returned by evaluating the last *form* in the selected clause or *nil*

## Returns

The values returned by the last form in the matching *normal-clause*; otherwise the values returned by the last form in the *otherwise-clause*, if specified; otherwise *nil*.

## Detailed syntax

*normal-clause* ::= (*keys form*\*)

*otherwise-clause* ::= ({*otherwise* | *t*} *form*\*)

## Terms

*test-key* An object produced by evaluating *keyform*

*keys* An object or a proper list of objects. To refer to the symbols *t* and *otherwise* by themselves as the sole key object for a *normal-clause*, (*t*) and (*otherwise*), respectively, must be specified as the *keys* for the clause.

*form* A form

## Description

The specified *test* symbol is not evaluated; however the comparison predicate that it designates must be available during expansion of the **case-using** form.

The *keyform* is first evaluated to produce the *test-key*.

Each of the *normal-clauses* is then considered in turn. If the *test-key* matches that clause according to *test*, then the forms in that clause are evaluated as an implicit *progn*, and the values it returns are returned as the value of the **case-using** form.

**Case-using** is a generalization of Common Lisp's *case* macro.

## See also

**ccase-using** (page 71)

**ecase-using** (page 90)

**Examples**

```
> (case-using string= "a"
  ("a" 1)
  (("b" "c" "d") 2))
1
> (case-using string= "d"
  ("a" 1)
  (("b" "c" "d") 2))
2
> (case-using string= "C"
  ("a" 1)
  (("b" "c" "d") 2))
nil
> (case-using string= "C"
  ("a" 1)
  (("b" "c" "d") 2)
  (otherwise -1))
-1
> (case-using equalp "C"
  ("a" 1)
  (("b" "c" "d") 2)
  (otherwise -1))
2
>
```

---

**case-using**

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Description

The condition **case-using-failure** is a subclass of `type-error`.

### See also

**case-using** (page [68](#))

**ccase-using** (page [71](#))

**ecase-using** (page [90](#))

---

---

**ccase-using** *test* *keyplace* {*clause*}\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Conditionally execute the forms in a clause that is selected by matching the result of evaluating *keyplace* according to *test*, generating a correctable error if no clause is selected.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*test* A symbol designating a comparison predicate (not evaluated)

*keyplace* A form; evaluated to produce a *test-key* and possibly also used later as a place if no *keys* match (see below)

*results* The values returned by evaluating the last *form* in the selected *clause*

## Returns

The values returned by the last form in the selected *clause*.

## Errors

No *clause* was selected.

## Detailed syntax

*clause* ::= (*keys form*\*)

## Terms

*test-key* An object produced by evaluating *keyplace*

*keys* An object or a proper list of objects.

*form* A form

## Description

The specified *test* symbol is not evaluated; however the comparison predicate that it designates must be available during expansion of the **ccase-using** form.

The *keyplace* is first evaluated to produce the *test-key*.

Each of the *clauses* is then considered in turn. If the *test-key* matches that clause according to *test*, then the forms in that clause are evaluated as an implicit `progn`, and the values it returns are returned as the value of the **ccase-using** form.

If no *clause* is selected, a correctable error of type `case-using-failure` (a subclass of `type-error`) is signaled. The offending datum is the *test-key* and the expected type is type equivalent to `(member (union keys :test test))`. Common Lisp's `store-value` restart can be used to correct the error.

**Ccase-using** is a generalization of Common Lisp's `ccase` macro.

## See also

**case-using-failure** (page [70](#))

**case-using** (page [68](#))

**ecase-using** (page [90](#))

## Examples

```

> (defparameter ** "a")
**
> (ccase-using string= **
    ("a" 1)
    (("b" "c" "d") 2))
1
> (setf ** "d")
"d"
> (ccase-using string= **
    ("a" 1)
    (("b" "c" "d") 2))
2
> (setf ** "C")
"C"
> (ccase-using string= **
    ("a" 1)
    (("b" "c" "d") 2))
Error: "C" fell through an ecase-using string= form;
      the valid keys are "a", "b", "c", and "d".

Restart actions (select using :c n):
  0: Supply a new value for **.
>> :c 0
Enter a form to evaluate as the new value for **: "a"
** is now "a"
1
>

```

---

## ccase-using

---

**compiler-macroexpand** *form* &optional *env* ⇒ *expansion*, *expanded-p*

---

[Function]

## Purpose

Expand *form* until it is no longer a compiler-macro form.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*form* A form

*env* An environment object (default is `nil`)

*expansion* A form

*expanded-p* A generalized boolean

## Returns

Two values:

- if *form* is a compiler-macro form, then return the repeatedly expanded compiler-macro form and `true`
- otherwise, return the given *form* and `nil`

## Description

*Form* is expanded repeatedly by calling **compiler-macroexpand-1** until it is no longer a compiler-macro form.

## See also

**compiler-macroexpand-1** (page [74](#))

## Examples

```
> (compiler-macroexpand '(ensure-list x))
(let ((#:g7105 x)) (if (listp #:g7105) #:g7105 (list #:g7105)))
t
> (compiler-macroexpand '(cons x nil))
(cons x nil)
nil
>
```

---

**compiler-macroexpand-1** *form* &optional *env* ⇒ *expansion*, *expanded-p*

---

[Function]

## Purpose

Expand *form* if it is a compiler-macro form.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*form* A form

*env* An environment object (default is `nil`)

*expansion* A form

*expanded-p* A generalized boolean

## Returns

Two values:

- if *form* is a compiler-macro form, then return the compiler-macro expansion of *form* and `true`
- otherwise, return the given *form* and `nil`

## Description

If *form* is a compiler-macro form, then **compiler-macroexpand-1** expands the compiler-macro-form call once.

## See also

**compiler-macroexpand** (page [73](#))

## Examples

```
> (compiler-macroexpand-1 '(ensure-list x))
(let ((#:g7105 x)) (if (listp #:g7105) #:g7105 (list #:g7105)))
t
> (compiler-macroexpand-1 '(cons x nil))
(cons x nil)
nil
>
```

---

**counted-delete** *item sequence &key from-end test test-not start end count key* [Function]  
⇒ *result-sequence, count*

---

## Purpose

A version of `delete` that returns the number of items that were deleted as a second value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*sequence* A proper sequence

*from-end* A generalized boolean (default is `nil`)

*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is `#'eql`)

*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of `:test-not` is deprecated)

*start* Starting index into *sequence* (default is 0)

*end* Ending index into *sequence* (default is `nil`, meaning end of *sequence*)

*count* An integer or `nil` (default is `nil`)

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

*result-sequence* A sequence

## Returns

Two values:

- the *sequence* from which the elements that satisfy the *test* have been removed
- the number of items that have been removed, or `nil`

## Description

Returns a sequence from which elements that satisfy the *test* have been deleted. The supplied *sequence* may be modified in constructing the result; however, modification of the supplied *sequence* itself is not guaranteed.

Specifying a *from-end* value of true matters only when the *count* is provided, and in that case only the rightmost *count* elements satisfying the *test* are deleted.

## See also

**atomic-delete** (page [230](#))

**delq** (page [80](#))

**delq-one** (page [81](#))

## Examples

```
> (counted-delete 'a '(a b c a b c))
(b c b c)
2
> (counted-delete #\a "abcabc")
```

```
"bcbc"  
2  
> (counted-delete 'z '(a b c a b c))  
(a b c a b c)  
0  
> (counted-delete #\a "abcabc" :from-end 't :count 1)  
"abcabc"  
1  
>
```

## Note

This is what `delete` should have been (and was on the Lisp Machines).

---

## counted-delete

---

**decf-after** *place* &optional *decrement* ⇒ *original-value*

---

[Macro]

## Purpose

Decrement the value of *place*, returning the original value of *place*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*place* A form which is suitable for use as a generalized reference

*decrement* A number (default is 1)

*original-value* A number

## Returns

The original value of *place*.

## See also

**incf-after** (page [94](#))

## Examples

```
> (defparameter *x* 4)
*x*
> (decf-after *x*)
4
> *x*
3
> (decf-after *x* 3)
3
> *x*
0
>
```

## Note

Declared numeric (see page [143](#)) and pseudo probability (see page [149](#)) versions of **decf-after** are also provided: **decf-after&**, **decf-after\$&**, **decf-after\$**, **decf-after\$\$**, **decf-after\$\$\$**, and **decf-after%**.

---

---

**decf/delete-acons** *item* *decrement* *place* &key *key* *test* *test-not* ⇒ *new-place-value* [Macro]

---

## Purpose

Decrement by *decrement* the value associated with *item* in an association list stored in *place*, deleting the cons associated with *item* if the value becomes zero.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object  
*decrement* A number  
*place* A form which is suitable for use as a generalized reference  
*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)  
*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is `#'eql`)  
*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of `:test-not` is deprecated)  
*new-place-value* An association list

## Returns

An association list (the new value of *place*).

## Errors

Item *item* is not present in the association list stored in *place*.

## Description

This is the inverse of **pushnew/incf-acons**.

## See also

**pushnew/incf-acons** (page [113](#))

## Examples

```
> (setf alist '((x . 2) (y . 2))
((x . 2) (y . 2))
> (decf/delete-acons 'x 1 alist)
((x . 1) (y . 2))
> (decf/delete-acons 'x 1 alist)
((y . 2))
> (decf/delete-acons 'y 2 alist)
nil
>
```

## Note

Declared numeric (see page 143) and pseudo probability (see page 149) versions of **decf/delete-acons** are also provided: **decf&/delete-acons**, **decf\$/delete-acons**, **decf\$/delete-acons**, **decf\$\$/delete-acons**, **decf\$\$\$/delete-acons**, and **decf<sup>o</sup>/delete-acons**,

---

**decf/delete-acons**

---

**delq** *item list* ⇒ *list*

---

[Function]

## Purpose

Destructively delete all *item* elements from *list* using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*list* A proper list

## Returns

A list from which all *item* elements have been deleted.

## Description

**Delq** is a convenient shorthand for:

```
(delete item (the list list) :test #'eq)
```

As is the case with `delete`, **delq** may modify the top-level structure of *list* in constructing the *result-list*.

## See also

**atomic-delete** (page [230](#))

**counted-delete** (page [75](#))

**delq-one** (page [81](#))

## Examples

```
> (delq 'b '(a b c b))
(a c)
> (delq 'x '(a b c b))
(a b c b)
>
```

---

## Purpose

Destructively delete the first occurrence of *item* from *list* using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*list* A proper list

## Returns

A list from which the first *item* element has been deleted.

## Description

**Delq-one** is a convenient and efficient shorthand for:

```
(delete item (the list list) :test #'eq :count 1)
```

As is the case with `delete`, **delq-one** may modify the top-level structure of *list* in constructing the *result-list*.

## See also

**atomic-delete** (page [230](#))

**counted-delete** (page [75](#))

**delq** (page [80](#))

## Examples

```
> (delq-one 'b '(a b c b))  
(a c b)  
> (delq-one 'x '(a b c b))  
(a b c b)  
>
```

---

---

**defcm** *name lambda-list* *[[declaration\* | documentation]] form\**  $\Rightarrow$  *name* [Macro]

---

## Purpose

Define a read-time conditional compiler macro.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*name* A non-`nil`, non-keyword symbol that names a function or macro  
*lambda-list* A lambda-list  
*declaration* A declare expression (not evaluated)  
*documentation* A documentation string (not evaluated)  
*form* A form

## Returns

The supplied *name*.

## Description

**Defcm** is a read-time conditional version of Common Lisp's `define-compiler-macro`. As with `define-compiler-macro`:

- The expander function is installed as a compiler macro function for *name*.
- The `&whole` argument is bound to the form argument that is passed to **defcm**. The remaining *lambda-list* parameters are specified as if this form contained the function name in the `car` and the actual arguments in the `cdr`. However, if the `car` of the actual form is the symbol `funcall`, then the destructuring of the arguments is actually performed using its `cddr` instead.
- Documentation is attached as a documentation string to *name* (as kind `compiler-macro`) and to the compiler macro function.
- A compiler macro can decline to provide an expansion merely by returning the original form (which can be obtained by using `&whole`).

A compiler macro is not defined if the feature **:disable-compiler-macros** or the feature **:full-safety** is present when the expander function is executed on a form.

## See also

**:disable-compiler-macros** (page 62)

**:full-safety** (page 63)

## Example

Here is the compiler macro defined for **ensure-list**:

```
> (defcm ensure-list (x)
  (with-once-only-bindings (x)
    `(if (listp ,x) ,x (list ,x))))
ensure-list
>
```

---

**define-class** *class-name* (*{superclass-name}*\*) (*{slot-specifier}*\*) *{class-option}*\* [Macro]  
⇒ *new-class*

---

## Purpose

Extended macro for defining or redefining a class.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*class-name* A non-nil, non-keyword symbol that names the class  
*superclass-name* A non-nil, non-keyword symbol that specifies a direct superclass of the class  
*class-name*  
*slot-specifiers* See below  
*class-options* See below  
*new-class* A new or modified class object

## Returns

The newly defined or modified class object.

## Detailed syntax

*slot-specifier* ::= *slot-name* |  
                  (*slot-name* [*{slot-option}*])  
*slot-option* ::= {*accessor reader-function-name*}\* |  
                  {*allocation allocation-type*} |  
                  {*documentation string*} |  
                  {*initarg initarg-name*}\* |  
                  {*initform form*} |  
                  {*reader reader-function-name*}\* |  
                  {*type type-specifier*} |  
                  {*writer writer-function-name*}\*  
*class-option* ::= (:default-initargs . *initarg-list*) |  
                  (:documentation *string*) |  
                  (:export-accessors *boolean*) |  
                  (:export-class-name *boolean*) |  
                  (:export-slot-names *slots-specifier*) |  
                  (:generate-accessors *slots-specifier*) |  
                  (:generate-accessors-format {*prefix* | *suffix*}) |  
                  (:generate-accessors-prefix {*string* | *symbol*}) |  
                  (:generate-accessors-suffix {*string* | *symbol*}) |  
                  (:generate-initargs *slots-specifier*) |  
                  (:metaclass *class-name*)  
*slots-specifier* ::= nil | t | *included-slot-name*\* |  
                  {t :exclude *excluded-slot-name*\*}

## Terms

*class-name* A non-nil, non-keyword symbol that names a class

*documentation* A documentation string  
*initarg-list* An initialization argument list  
*slot-name* A non-nil, non-keyword symbol

## Description

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class `standard-object`.

The `:metaclass` class option, if specified, must be a subclass of `standard-class`. The default metaclass value is `standard-class`.

## See also

**define-unit-class** (page [330](#))  
**make-instance** (page [364](#))  
**with-generate-accessors-format** (page [136](#))

## Examples

Define a class, `rectangle`, generating “-of” slot accessors:

```
> (define-class rectangle (point)
    (length width))
#<standard-class rectangle>
>
```

Define a class, `foo`, generating “*class-name . slot-name*” slot accessors:

```
> (define-class foo ()
    ((slot :initform ' :uninitialized))
    (:generate-accessors-format :prefix))
#<standard-class foo>
>
```

---

## define-class

## Purpose

Evaluates *form* and then *test-form* repeatedly, as long as *test-form* evaluates to `nil`.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*form* A form

*test-form* A form

## See also

**do-while** (page [86](#))

**until** (page [130](#))

**while** (page [131](#))

## Examples

```
> (let ((i 0))
    (do-until (print i)
              (> (incf i) 3)))
1
2
3
nil
> (let ((i 10))
    (do-until (print i)
              (> (incf i) 3)))
10
nil
>
```

---

**Purpose**

Evaluates *form* and then *test-form* repeatedly, until *test-form* evaluates to `nil`.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Arguments**

*form* A form

*test-form* A form

**See also**

**do-until** (page [85](#))

**until** (page [130](#))

**while** (page [131](#))

**Examples**

```
> (let ((i 0))
    (do-while (print i)
              (<= (incf i) 3)))
1
2
3
nil
> (let ((i 10))
    (do-while (print i)
              (<= (incf i) 3)))
10
nil
>
```

---

**dosequence** (*var sequence-form* [*result-form*]) *declaration*\* {*tag* | *form*}\* ⇒ *result*\* or *nil* [*Macro*]

---

## Purpose

A generalized `dolist`-style iterator for any sequence.

**Package** :`gbbopen-tools`

**Module** :`gbbopen-tools`

## Arguments

*var* A variable symbol

*sequence-form* A form that evaluates to a sequence

*result-form* A form

*declarations* A declare expression (not evaluated)

*tag* A `go` tag (not evaluated)

*form* A form

*results* The values returned by evaluating the last *form*

## Returns

If a `return` or `return-from` form is executed, then the values passed from that form are returned; otherwise, the values returned by evaluating the *result-form* are returned, or `nil` if there is no *result-form*.

## Description

The body of **dosequence** is like a `tagbody`. **Dosequence** evaluates *sequence-form*, which should produce a sequence. It then executes the body once for each element in the sequence, with *var* bound to the element.

The scope of the binding of *var* does not include the *sequence-form*, but it does include the *result-form*.

## See also

**dosublists** (page [88](#))

## Examples

```
> (dosequence (elt #(1 2 3)) (print elt))
1
2
3
nil
> (dosequence (char "abc") (print char))
#\a
#\b
#\c
nil
>
```

---

**dosublists** (*var list-form* [*result-form*]) *declaration*\* {*tag* | *form*}\* ⇒ *result*\* or *nil* [*Macro*]

---

## Purpose

A `dolist`-style iterator for successive sublists of a list.

**Package** :`gbbopen-tools`

**Module** :`gbbopen-tools`

## Arguments

*var*            A variable symbol  
*list-form*     A form that evaluates to a proper list  
*result-form*   A form  
*declarations* A declare expression (not evaluated)  
*tag*            A `go` tag (not evaluated)  
*form*          A form  
*results*        The values returned by evaluating the last *form*

## Returns

If a `return` or `return-from` form is executed, then the values passed from that form are returned; otherwise, the values returned by evaluating the *result-form* are returned, or `nil` if there is no *result-form*.

## Description

The body of **dosublists** is like a `tagbody`. **Dosublists** evaluates *list-form*, which should produce a proper list. It then executes the body once for each successive sublist in the list, with *var* bound to the sublist.

The scope of the binding of *var* does not include the *list-form*, but it does include the *result-form*.

## Examples

```
> (dosublists (sublist '(1 2 3)) (print sublist))
(1 2 3)
(2 3)
(3)
nil
> (dosublists (sublist '(1 2 3) (print "Done")) (print sublist))
(1 2 3)
(2 3)
(3)
"Done"
>
```

---

**dotted-length** *list* ⇒ *n*

---

[*Function*]

### **Purpose**

Return the length of a proper list or dotted list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### **Arguments**

*list* A proper list or a dotted list

*n* An integer

### **Returns**

The length of *list*.

### **Examples**

```
> (dotted-length '(a b))
2
> (dotted-length '(a b . c))
2
>
```

### **Note**

This function will not work on a circular list.

---

---

**ecase-using** *test keyform {clause}\* ⇒ result\**

---

[Macro]

## Purpose

Conditionally execute the forms in a clause that is selected by matching the result of evaluating *keyform* according to *test*, generating an error if no clause is selected.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*test* A symbol designating a comparison predicate (not evaluated)

*keyform* A form; evaluated to produce a *test-key* (see below)

*results* The values returned by evaluating the last *form* in the selected *clause*

## Returns

The values returned by the last form in the selected *clause*.

## Errors

No *clause* was selected.

## Detailed syntax

*clause* ::= (*keys form*\*)

## Terms

*test-key* An object produced by evaluating *keyform*

*keys* An object or a proper list of objects.

*form* A form

## Description

The specified *test* symbol is not evaluated; however the comparison predicate that it designates must be available during expansion of the **ecase-using** form.

The *keyform* is first evaluated to produce the *test-key*.

Each of the *clauses* is then considered in turn. If the *test-key* matches that clause according to *test*, then the forms in that clause are evaluated as an implicit `progn`, and the values it returns are returned as the value of the **ecase-using** form.

If no *clause* is selected, a non-correctable error of type `case-using-failure` (a subclass of `type-error`) is signaled. The offending datum is the *test-key* and the expected type is type equivalent to `(member (union keys :test test))`.

**Ecasing** is a generalization of Common Lisp's `ecase` macro.

## See also

**case-using-failure** (page [70](#))

**case-using** (page [68](#))

**ccase-using** (page [71](#))

**Examples**

```
> (ecase-using string= "a"
   ("a" 1)
   ("b" "c" "d") 2))
1
> (ecase-using string= "d"
   ("a" 1)
   ("b" "c" "d") 2))
2
> (ecase-using string= "C"
   ("a" 1)
   ("b" "c" "d") 2))
Error: "C" fell through an ecase-using string= form;
       the valid keys are "a", "b", "c", and "d".
>>
```

---

**ecase-using**

---

**ensure-finalized-class** *class* ⇒ *finalized-class*

---

[Function]

### Purpose

Finalizes *class* if it is not already finalized.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*class* A class designator

*finalized-class* A class object

### Returns

The finalized *class*.

### Example

```
> (ensure-finalized-class (find-class 'hyp))
#<standard-unit-class hyp>
>
```

### Note

This function is compiled in-line for top performance.

---

---

**ensure-list** *object* ⇒ *list*

---

[*Function*]

### **Purpose**

Construct a list containing an object, if the object is not already a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### **Arguments**

*object* An object

*list* A list

### **Returns**

The *object* if it is a list or, if *object* is an atom, a newly consed list containing *object* as its sole element.

### **Examples**

```
> (ensure-list 'x)
(x)
> (ensure-list '(x))
(x)
> (ensure-list nil)
nil
>
```

### **Note**

This function is compiled in-line for top performance.

---

---

**incf-after** *place* &optional *increment* ⇒ *original-value*

---

[*Macro*]

## Purpose

Increment the value of *place*, returning the original value of *place*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*place* A form which is suitable for use as a generalized reference

*increment* A number (default is 1)

*original-value* A number

## Returns

The original value of *place*.

## See also

**decf-after** (page [77](#))

## Examples

```
> (defparameter *x* 0)
*x*
> (incf-after *x*)
0
> *x*
1
> (incf-after *x* 3)
1
> *x*
4
>
```

## Note

Declared numeric (see page [143](#)) and pseudo probability (see page [149](#)) versions of **incf-after** are also provided: **incf-after&**, **incf-after\$&**, **incf-after\$**, **incf-after\$\$**, **incf-after\$\$\$**, and **incf-after%**.

---

---

**list-length-1-p** *list* ⇒ *boolean*

---

[Function]

## Purpose

Fast length = 1 test of a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list or a dotted list

*boolean* A generalized boolean

## Returns

True if *list* has length 1; nil otherwise.

## See also

**list-length>** (page [97](#))

**list-length>1** (page [98](#))

**list-length>2** (page [99](#))

**list-length-2-p** (page [96](#))

## Examples

```
> (list-length-1-p '(a))
t
> (list-length-1-p '(a b))
nil
> (list-length-1-p nil)
nil
> (list-length-1-p '(a . b))
nil
>
```

---

**list-length-2-p** *list* ⇒ *boolean*

---

[Function]

## Purpose

Fast length = 2 test of a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list or a dotted list

*boolean* A generalized boolean

## Returns

True if *list* has length 2; nil otherwise.

## See also

**list-length-1-p** (page [95](#))

**list-length>** (page [97](#))

**list-length>1** (page [98](#))

**list-length>2** (page [99](#))

## Examples

```
> (list-length-2-p '(a b))
t
> (list-length-2-p '(a b c))
nil
> (list-length-2-p '(a))
nil
> (list-length-2-p '(a b . c))
nil
>
```

---

**list-length>** *n list* ⇒ *boolean*

---

[*Function*]

## Purpose

Fast `length > n` test of a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*n* A non-negative fixnum

*list* A proper list or a dotted list

*boolean* A generalized boolean

## Returns

True if *list* has `length > n`; nil otherwise.

## See also

**list-length>** (page [97](#))

**list-length-1-p** (page [95](#))

**list-length-2-p** (page [96](#))

## Examples

```
> (list-length> 1 '(a b))
t
> (list-length> 2 '(a b))
nil
> (list-length> 1 '(a))
nil
> (list-length> 1 '(a . b))
nil
> (list-length> 1 '(a b . c))
t
>
```

---

**list-length>1** *list* ⇒ *boolean*

---

[*Function*]

## Purpose

Fast `length > 1` test of a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list or a dotted list

*boolean* A generalized boolean

## Returns

True if *list* has `length > 1`; `nil` otherwise.

## See also

**list-length>** (page [97](#))

**list-length-1-p** (page [95](#))

**list-length-2-p** (page [96](#))

## Examples

```
> (list-length>1 '(a b))
t
> (list-length>1 '(a))
nil
> (list-length>1 '(a . b))
nil
> (list-length>1 '(a b . c))
t
>
```

---

---

**list-length>2** *list* ⇒ *boolean*

---

[*Function*]

## Purpose

Fast `length > 2` test of a list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list or a dotted list

*boolean* A generalized boolean

## Returns

True if *list* has `length > 2`; nil otherwise.

## See also

**list-length>** (page [97](#))

**list-length>1** (page [98](#))

**list-length-1-p** (page [95](#))

**list-length-2-p** (page [96](#))

## Examples

```
> (list-length>2 '(a b c))
t
> (list-length>2 '(a b))
nil
> (list-length>2 '(a b . c))
nil
> (list-length>2 '(a b c . d))
t
>
```

---

**make-hash-values-vector** *hash-table* ⇒ *vector*

---

[*Function*]

### Purpose

Return a vector containing all values in *hash-table*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*hash-table* A hash table

*vector* A vector

### Returns

The newly allocated *vector*.

### Examples

```
> (defparameter *ht* (make-hash-table))
*ht*
> (make-hash-values-vector *ht*)
#()
> (setf (gethash 'a *ht*) 1)
1
> (setf (gethash 'b *ht*) 2)
2
> (setf (gethash 'c *ht*) 3)
3
> (make-hash-values-vector *ht*)
#(3 1 2)
>
```

---

**make-keyword**  $x \Rightarrow keyword$

[*Function*]

---

### **Purpose**

Return a keyword symbol as specified by  $x$ .

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### **Arguments**

$x$  A string, symbol, or character

$keyword$  A keyword symbol

### **Returns**

The keyword symbol.

### **Examples**

```
> (make-keyword 'gbbopen)
:gbbopen
> (make-keyword "GBBOPEN")
:gbbopen
> (make-keyword #\X)
:x
>
```

### **Note**

This function is compiled in-line for top performance.

---

---

**memq** *item list* ⇒ *tail*

[*Function*]

---

## Purpose

Search for *item* in *list* using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*list* A proper list

*tail* A proper list

## Returns

The tail of *list* beginning with *item* if *item* is present; `nil` otherwise.

## Description

**Memq** is a convenient shorthand for:

```
(member item (the list list) :test #'eq)
```

## See also

**counted-delete** (page [75](#))

**assq** (page [66](#))

**delq** (page [80](#))

**delq-one** (page [81](#))

## Examples

```
> (memq 'b '(a b c b))
(b c b)
> (memq 'x '(a b c b))
nil
>
```

---

**multiple-value-setf** (*place\**) *form*  $\Rightarrow$  *primary-value*

---

[*Macro*]

## Purpose

Assign values to *places*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*place* A form which is suitable for use as a generalized reference or `nil`

*form* A form

*primary-value* The first value returned by evaluating *form*

## Returns

The primary value returned by *form*.

## Description

The *form* is evaluated, and each *place* is assigned to the corresponding value returned by *form*. If `nil` is used one or more *places*, no assignment is made to the `nil` “place,” but the corresponding value is consumed (ignored). If there are more *places* than values returned, `nil` is assigned to the extra *places*. If there are more values than *places*, the extra values are discarded.

## Examples

```
> (setf *x* (cons 0 0))
(0 . 0)
> (multiple-value-setf ((car *x*) (cdr *x*)) (values 1 2 3))
1
> *x*
(1 . 2)
> (multiple-value-setf (nil nil (cdr *x*)) (values -1 -2 -3))
-1
> *x*
(1 . -3)
> (multiple-value-setf ((car *x*) (cdr *x*)) 100)
100
> *x*
(100)
> (multiple-value-setf ((car *x*) (cdr *x*)) nil)
nil
> *x*
(nil)
>
```

---

**nsorted-insert** *item list* &optional *predicate key* ⇒ *result-list*

---

[Function]

## Purpose

Positionally insert *item* in *list* based on *predicate* and *key* functions.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*list* A proper list

*predicate* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'<)

*key* A function designator specifying a function object of one argument, or nil (default is nil)

*result-list* A proper list

## Returns

A list into which *item* has been inserted.

## Description

The supplied *list* may be modified in constructing the result; however, modification of the supplied *list* itself is not guaranteed.

## Example

```
> (nsorted-insert 5 '(2 4 6 8))
(2 4 5 6 8)
>
```

---

---

**object-address** *object* &optional *hex-string-p* ⇒ *address*

---

[Function]

## Purpose

Return the internal address of *object*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*object* An object

*hex-string-p* A generalized boolean (default is nil)

*address* An integer or a string

## Returns

The integer internal address of *object* or a string containing the hexadecimal representation of the address if *hex-string-p* is true.

## Description

**Object-address** can be useful with **printv**.

## See also

**printv** (page [108](#))

## Examples

```
> (object-address *package*)
1907568474
> (object-address *package* 't)
"71B32F5A"
>
```

---

**print-instance-slot-value** *instance slot-name stream &key function no-space* [Generic Function]

---

## Purpose

Print the value of the *slot-name* slot in *instance* or [Unbound], if the slot is unbound.

## Method signatures

`print-instance-slot-value` (*instance* standard-gbbopen-instance) *slot-name stream*

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*instance* A standard-gbbopen-instance object

*slot-name* A non-nil, non-keyword symbol

*stream* A stream

*function* A function designator specifying a function object of one argument

*no-space* A generalized boolean (default is nil)

## Description

Unless *no-space* is true, a space character is printed to *stream*. Then the slot value in *instance* specified by *slot-name* is printed to *stream*, unless the slot is unbound, in which case [Unbound] is printed to *stream*.

If the slot is bound and *function* is specified, *function* is called with the slot value and the result is printed to *stream* rather than the slot value.

## See also

**print-instance-slots** (page [107](#))

**standard-gbbopen-instance** (page [126](#))

## Example

Extend the print-object printing for hyp instances to include location and belief slot values:

```
(defmethod print-instance-slots ((obj hyp) stream)
  (call-next-method)
  (print-instance-slot-value obj 'location stream)
  (print-instance-slot-value obj 'belief stream))
```

## Purpose

Extend standard-gbbopen-instance printing performed by `print-object` to include additional slot-value information.

## Method signatures

```
print-instance-slots (instance ksa) stream
print-instance-slots (instance link/nonlink-slot-event) stream
print-instance-slots (instance multiple-instances-event) stream
print-instance-slots (instance single-instance-event) stream
print-instance-slots (instance space-instance-event) stream
print-instance-slots (instance standard-event-instance) stream
print-instance-slots (instance standard-gbbopen-instance) stream
print-instance-slots (instance standard-unit-instance) stream
print-instance-slots :after (instance standard-unit-instance) stream
```

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*instance* A standard-gbbopen-instance object  
*stream* A stream

## See also

**print-instance-slot-value** (page [106](#))  
**standard-gbbopen-instance** (page [126](#))

## Examples

Extend the `print-object` printing for `hyp` instances to include location and belief slot values:

```
(defmethod print-instance-slots ((obj hyp) stream)
  (call-next-method)
  (when (and (slot-boundp obj 'location)
             (slot-boundp obj 'belief))
    (format stream " ~s ~s"
             (slot-value obj 'location)
             (slot-value obj 'belief))))
```

or if displaying `[Unbound]` for unbound slots is desired:

```
(defmethod print-instance-slots ((obj hyp) stream)
  (call-next-method)
  (print-instance-slot-value obj 'location stream)
  (print-instance-slot-value obj 'belief stream))
```

---

**printv** *form*\* ⇒ *result*\*

[*Macro*]

---

## Purpose

Assist debugging by printing forms and the results of evaluating them to *\*trace-output\**.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

## Arguments

*forms* An implicit `progn` of forms to be evaluated and printed

*results* The values returned by evaluating the last *form* that is not the keyword symbol `:hr`

## Returns

The values returned by evaluating the last *form* that is not the keyword symbol `:hr`

## Description

The following is performed for each form in *forms*:

- if the form is the keyword symbol `:hr`, a dashed separator line printed to *\*trace-output\**
- if the form is a string (before evaluation), it is treated as a label and printed to *\*trace-output\** without enclosing double-quote characters
- if the form is a self-evaluating object, it is printed to *\*trace-output\**
- otherwise, the form is printed to *\*trace-output\**, then the form is evaluated and the result values are printed to *\*trace-output\**.

## See also

**printvot** (page [201](#))

## Examples

```
> (printv :hr "PRINTV example" (list 1 2) (list 3 4) ' "A quoted string"
      "Return no values:" (values)
      "Return multiple values:" (values 5 6) :hr)

;; -----
;; PRINTV example
;; (list 1 2) => (1 2)
;; (list 3 4) => (3 4)
;; Return no values:
;; (values) => [returned 0 values]
;; ' "A quoted string" => "A quoted string"
;; Return multiple values:
;; (values 5 6) => 5; 6
;; -----
5
6
> (printv *package* (object-address *package* 't))
;; *package* => #<The GBBOPEN-USER package>
;; (object-address *package* 't) => "71b32f5a"
```

```
"71b32f5a"  
>
```

### Note

This macro is defined in the `:module-manager` module in order to make it available as early as possible.

---

**printv**

---

**push-acons** *item value place* ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Add a new *item value* cons to an association list stored in *place*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*value* An object

*place* A form which is suitable for use as a generalized reference

*new-place-value* An association list

## Returns

An association list (the new value of *place*).

## See also

**pushnew-acons** (page [111](#))

**pushnew/incf-acons** (page [113](#))

## Examples

```
> (setf alist nil)
nil
> (push-acons 'x 1 alist)
((x . 1))
> (push-acons 'y 2 alist)
((y . 2) (x . 1))
> alist
((y . 2) (x . 1))
>
```

---

**pushnew-acons** *item value place* &key *key test test-not* ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Replace the *value* associated with *item* in an association list stored in *place* or add a new (*item* . *value*) cons to the association list if there is no existing association for *item*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object  
*value* An object  
*place* A form which is suitable for use as a generalized reference  
*key* A function designator specifying a function object of one argument, or nil (default is nil)  
*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)  
*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of :test-not is deprecated)  
*new-place-value* An association list

## Returns

An association list (the new value of *place*).

## See also

**push-acons** (page [110](#))

**pushnew/incf-acons** (page [113](#))

## Examples

```
> (setf alist nil)
nil
> (pushnew-acons 'x 1 alist)
((x . 1))
> (pushnew-acons 'y 2 alist)
((y . 2) (x . 1))
> (pushnew-acons 'x -1 alist)
((y . 2) (x . -1))
> alist
((y . 2) (x . -1))
>
```

---

**pushnew-elements** *list place* &key *key test test-not* ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Pushes new elements in *list* onto the list stored in *place*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list  
*place* A form which is suitable for use as a generalized reference  
*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)  
*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is `#'eql`)  
*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of `:test-not` is deprecated)  
*new-place-value* An association list

## Returns

The new value of *place*.

## Description

Each element in *list* is checked to see if it is already present in the proper list stored in *place*. If the element is not already present, it is prepended to the list stored in *place*.

## Examples

```
> (setf x '(1 3 5))
(1 3 5)
> (pushnew-elements '(1 2 3) x)
(2 1 3 5)
> (pushnew-elements '(3 4 5) x)
(4 2 1 3 5)
>
```

---

**pushnew/incf-acons** *item increment place* &key *key test test-not* ⇒ *new-place-value* [Macro]

---

## Purpose

Increment by *increment* the value associated with *item* in an association list stored in *place* or add a new (*item* . *increment*) cons to the association list if there is no existing association for *item*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object  
*increment* A number  
*place* A form which is suitable for use as a generalized reference  
*key* A function designator specifying a function object of one argument, or nil (default is nil)  
*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)  
*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of :test-not is deprecated)  
*new-place-value* An association list

## Returns

An association list (the new value of *place*).

## See also

**push-acons** (page [110](#))

**pushnew-acons** (page [111](#))

**decf/delete-acons** (page [78](#))

## Examples

```
> (setf alist nil)
nil
> (pushnew/incf-acons 'x 1 alist)
((x . 1))
> (pushnew/incf-acons 'x 1 alist)
((x . 2))
> (pushnew/incf-acons 'y 2 alist)
((y . 2) (x . 2))
> (pushnew/incf-acons 'x -1 alist)
((y . 2) (x . 1))
> alist
((y . 2) (x . 1))
>
```

**Note**

Declared numeric (see page 143) and pseudo probability (see page 149) versions of **pushnew/incf-acons** are also provided: **pushnew/incf&-acons**, **pushnew/incf\$&-acons**, **pushnew/incf\$acons**, **pushnew/incf\$\$-acons**, **pushnew/incf\$\$\$-acons**, and **pushnew/incf%-acons**.

---

**pushnew/incf-acons**

---

**remove-properties** *plist indicators* ⇒ *new-plist*

---

[Function]

## Purpose

Non-destructively removes properties from a property list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*plist* A property list

*indicators* A list of objects

*new-plist* A property list

## Returns

The new property list.

## Description

All instances of each specified property in the property list are removed.

## See also

**remove-property** (page [116](#))

## Examples

```
> (remove-properties '( :x 1 :y 2 :z 3) '( :y))
(:x 1 :z 3)
> (remove-properties '( :x 1 :y 2 :x 11 :y 12 :z -1) '( :z :y))
(:x 1 :x 11)
> (remove-properties '( :x 1 :y 2 :z 3) '( :missing))
(:x 1 :y 2 :z 3)
>
```

---

**remove-property** *plist indicator* ⇒ *new-plist*

---

[Function]

## Purpose

Non-destructively remove a property from a property list.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*plist* A property list

*indicator* An object

*new-plist* A property list

## Returns

The new property list.

## Description

If there is more than one instance of property in the property list, only the first one is removed.

## See also

**remove-properties** (page [115](#))

## Examples

```
> (remove-property '( :x 1 :y 2 :z 3) :y)
(:x 1 :z 3)
> (remove-property '( :x 1 :y 2 :x 11 :y 12) :y)
(:x 1 :x 11 :y 12)
> (remove-property '( :x 1 :y 2 :z 3) :missing)
(:x 1 :y 2 :z 3)
>
```

---

**set-equal** *list-1 list-2* &key *test test-not key* ⇒ *boolean*

---

[Function]

## Purpose

Determine if all elements in two lists are present in both lists.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list-1* A proper list

*list-2* A proper list

*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)

*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of :test-not is deprecated)

*key* A function designator specifying a function object of one argument, or nil (default is nil)

*boolean* A generalized boolean

## Returns

True if all elements in *list-1* are also in *list-2* and vice versa; nil otherwise.

## Description

Duplicate elements in either list are permitted, so the lengths of *list-1* and *list-2* can differ and still return true.

## Examples

```
> (set-equal '(1 2 3) '(3 2 1))
t
> (set-equal '(1 2) '(3 2 1))
nil
> (set-equal '(1 2 3) '(3 1))
nil
> (set-equal '(1 2 3) '(3 3 3 2 1))
t
> (set-equal '(1 2 3) '(4 5 6 7) :test #'/=)
t
>
```

---

**sets-overlap-p** *list-1 list-2* &key *test test-not key* ⇒ *boolean*

---

[Function]

## Purpose

Determine if any element in *list-1* appears in *list-2*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list-1* A proper list

*list-2* A proper list

*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)

*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of :test-not is deprecated)

*key* A function designator specifying a function object of one argument, or nil (default is nil)

*boolean* A generalized boolean

## Returns

True if any element in *list-1* is also in *list-2*; nil otherwise.

## Description

Duplicate elements in either list are permitted.

## Examples

```
> (sets-overlap-p '(1 2 3) '(3 4 5))
t
> (sets-overlap-p '(1 2) '(3 4 5))
nil
> (sets-overlap-p '(1 3 7) '(3 4 5 6) :test #'/=)
t
>
```

---

**shuffle-list** *list* ⇒ *shuffled-list*

---

[Function]

### Purpose

Return a copy of a list, with the elements in random order.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*list* A proper list

*shuffled-list* A proper list

### Returns

The shuffled copy of *list*.

### Examples

```
> (shuffle-list '(a b c d))
(b a c d)
> (shuffle-list '(a b c d))
(c a d b)
>
```

---

---

**shrink-vector** *vector length* ⇒ *vector*

---

[*Function*]

### Purpose

Shorten a one-dimensional simple array destructively, if possible.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*vector* A “simple” vector that is a one-dimensional simple array

*length* A non-negative integer, not greater than the length of *vector*

### Returns

The truncated *vector*, which may not be identical (e<sub>q</sub>) to the original *vector* argument on some Common Lisp implementations.

### Description

This function provides access to the Common Lisp implementation’s low-level truncation operation.

### Example

```
> (shrink-vector "abcdefghijklmnopqrstuvwxy" 3)
"abc"
>
```

### Note

This function is compiled in-line for top performance.

---

---

**sole-element** *list* ⇒ *element* or nil

---

[Function]

## Purpose

Return the first element of a list containing, at most, one element.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list

*element* An object

## Returns

The sole element of *list* or nil.

## Errors

*List* contains more than one element.

## Description

If *list* is a cons, **sole-element** returns the car of that cons. If *list* is nil, **sole-element** returns nil. If *list* is a cons and the cdr of that cons is not nil, a continuable error is signaled. If you continue from the error, the first element is returned.

This function is preferable to **car** when you expect a list of, at most, one element. For example, this function is often used on the results of calling **find-instances** or **filter-instances** when only a single unit instance is expected in the result list.

## Examples

```
> (sole-element '(a))
a
> (sole-element nil)
nil
> (sole-element '(a b))
Error: The list (a b) contains more than 1 element.
      If continued - Ignore the remaining elements.
>>
```

## Note

This function is compiled in-line for top performance.

---

---

**splitting-butlast** *list* &optional *n* ⇒ *result-list*, *tail*

---

[Function]

## Purpose

Return all but the last *n* elements of *list* and, as a second value, the tail containing those last *n* elements.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*list* A proper list or a dotted list

*n* A non-negative integer (default is 1)

*result-list* A proper list

*tail* A proper list or a dotted list

## Returns

Two values:

- a copy of *list* up to, but not including, the last *n* conses
- the unused tail of *list*

## Examples

```
> (splitting-butlast '(a b c d e))
(a b c d)
(e)
> (splitting-butlast '(a b c d e) 3)
(a b)
(c d e)
> (splitting-butlast '(a b . c))
(a)
(b . c)
>
```

## Purpose

Apply a function once to each of the entries in a hash table according to the entry-key order determined by the *predicate* function

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*function* A function designator specifying a function object of two arguments, the key and value of the hash-table entry

*hash-table* A hash table

*predicate* A function designator specifying a function object of two arguments that returns a generalized boolean

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

## Description

For each entry in the hash table, the *function* is called with two arguments—the key and the value of that entry.

The first argument to the *predicate* function is the key of one entry in the hash table (or part of that key extracted by the *key* function, if supplied); the second argument is the key of another entry in the hash table (or part of that key extracted by the *key* function, if supplied). The *predicate* function should return true if and only if the first argument is strictly less than the second; otherwise the predicate should return false.

## Example

Print a list of entries in `hash-table`, in ascending order of their keys (which are strings):

```
(sorted-maphash
  #'(lambda (key value)
      (format t "~&; key: ~s value: ~s~%" key value)
    hash-table
    #'string<)
```

---

## Purpose

Sort the sequence value of *place*, and change the value of *place* to the sorted result.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*place* A form which is suitable for use as a generalized reference

*predicate* A function designator specifying a function object of two arguments that returns a generalized boolean

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

## Description

The first argument to the *predicate* function is one element of the sequence value in *place* (or part of that element extracted by the *key* function, if supplied); the second argument another element of the sequence (or part of that element extracted by the *key* function, if supplied). The *predicate* function should return true if and only if the first argument is strictly less than the second; otherwise the predicate should return false.

The sorting operation can be destructive, and it is not guaranteed stable. Elements considered equal by *predicate* might not stay in their original order.

## See also

**stable-sortf** (page [125](#))

## Example

```
> (defparameter **x* '(1 5 3 2 4))
**x*
> (sortf **x* '<)
(1 2 3 4 5)
> **x*
(1 2 3 4 5)
>
```

---

## Purpose

Stably sort the sequence value of *place*, and change the value of *place* to the sorted result.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*place* A form which is suitable for use as a generalized reference

*predicate* A function designator specifying a function object of two arguments that returns a generalized boolean

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

## Description

The first argument to the *predicate* function is one element of the sequence value in *place* (or part of that element extracted by the *key* function, if supplied); the second argument another element of the sequence (or part of that element extracted by the *key* function, if supplied). The *predicate* function should return true if and only if the first argument is strictly less than the second; otherwise the predicate should return false.

The sorting operation can be destructive. Elements considered equal by *predicate* stay in their original order.

## See also

**sortf** (page [124](#))

## Example

```
> (defparameter **x* '(1 2 3 6 5 4))
**x*
> (stable-sortf **x* #'(lambda (x y) (and (oddp x) (evenp y))))
(1 3 5 2 6 4)
> **x*
(1 3 5 2 6 4)
>
```

---

**standard-gbbopen-instance****[Class]**

---

**Package** :gbbopen-tools**Module** :gbbopen-tools**Description**

The class **standard-gbbopen-instance** is a subclass of `standard-object`. It is a superclass of **deleted-unit-instance**, **standard-event-instance**, **standard-link-pointer**, and **standard-unit-instance**.

**See also****deleted-unit-instance** (page [337](#))**print-instance-slots** (page [107](#))**standard-event-instance** (page [411](#))**standard-link-pointer** (page [388](#))**standard-unit-instance** (page [370](#))

---

---

**trimmed-substring** *character-bag string* &optional *start end* ⇒ *trimmed-substring* [Function]

---

## Purpose

Extract and trim a substring from *string*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*character-bag* A sequence containing characters

*string* A string designator

*start* Starting index into *string* (default is 0)

*end* Ending index into *string* (default is `nil`, meaning end of *string*)

*trimmed-substring* A string

## Returns

The extracted, trimmed string

## Examples

```
> (trimmed-substring '(#\space #\tab) "xxx  abc  yyy" 3 12)
"abc"
> (trimmed-substring " " "xxx  abc  yyy" 3 12)
"abc"
> (trimmed-substring " " "xxx  abc  yyy" 3)
"abc  yyy"
> (trimmed-substring " " "xxx  abc  yyy" 3 13)
"abc  y"
> (trimmed-substring " " "xxx  abc  yyy" 2 12)
"x  abc"
> (trimmed-substring " " "  abc  ")
"abc"
>
```

## Note

The function **trimmed-substring** is semantically equivalent to

```
(string-trim character-bag (subseq string start end))
```

but avoids allocating an intermediate substring.

---

---

**undefmethod** *function-name* {*method-qualifier*}\* *specialized-lambda-list* [*Macro*]  
[[*declaration*\* | *documentation*]] *form*\*

---

## Purpose

Locate and undefine a method.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>function-name</i>	Either a symbol or <code>(setf <i>symbol</i>)</code>
<i>method-qualifier</i>	A non-list method qualifier object (such as <code>:before</code> , <code>:after</code> , or <code>:around</code> )
<i>specialized-lambda-list</i>	A specialized lambda list (as per <code>defmethod</code> )
<i>declarations</i>	A declare expression (not evaluated)
<i>documentation</i>	A documentation string (not evaluated)
<i>forms</i>	Zero or more forms

## See also

**continue-patch** (page [28](#))

**finish-patch** (page [40](#))

**patch** (page [53](#))

**start-patch** (page [57](#))

## Example

After creating an undesired method, use **undefmethod** to remove it:

```
> (defmethod instance-name-of :before ((instance standard-unit-instance))
    (print "Oops"))
#<standard-method instance-name-of :before (standard-unit-instance)>
> (instance-name-of (find-instance-by-name 112 'hyp))
"Oops"
112
> (undefmethod instance-name-of :before ((instance standard-unit-instance)))
#<standard-generic-function instance-name-of>
> (instance-name-of (find-instance-by-name 112 'hyp))
112
>
```

## Note

This macro may not be able to locate and undefine some methods with environment-specific `eql` specializers.

---

**Purpose**

Represent an unbound value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A keyword symbol

**Value** :---unbound---

**See also**

**define-unit-class** (page [330](#))

**Example**

Define a slot-reader function that returns the value of `my-slot` or **unbound-value-indicator** if the slot is unbound:

```
(defun safe-my-slot-of (instance)
  (if (slot-bound-p instance 'my-slot)
      (slot-value instance 'my-slot)
      unbound-value-indicator))
```

---

**until** *test-form* *declaration*\* *form*\*

[*Macro*]

---

## Purpose

Evaluates *test-form* and each *form* repeatedly, as long as *test-form* evaluates to `nil`.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*test-form* A form

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

## See also

**do-until** (page [85](#))

**do-while** (page [86](#))

**while** (page [131](#))

## Examples

```
> (let ((i 0))
    (until (> (incf i) 3)
          (print i)))
1
2
3
nil
> (until 't (print "No"))
nil
>
```

---

**while** *test-form* *declaration*\* *form*\*

[*Macro*]

---

## Purpose

Evaluates *test-form* and each *form* repeatedly, until *test-form* evaluates to `nil`.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*test-form* A form

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

## See also

**do-until** (page [85](#))

**do-while** (page [86](#))

**until** (page [130](#))

## Examples

```
> (let ((i 0))
    (while (<= (incf i) 3)
      (print i)))
1
2
3
nil
> (while nil (print "No"))
nil
>
```

---

---

**with-error-handling** [*form* | (*form* [(:conditions *type*)] *handler-form*\*) *error-form*\*] *error-form*\*    [Macro]  
⇒ *result*\*

---

## Purpose

Evaluate each *handler-form* and each *error-form* if an error occurs while evaluating *form*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*form*            A form

*type*            A type specifier (default is (and error (not interrupt-signal)) on [Allegro CL](#); otherwise error)

*handler-forms* Zero or more forms

*error-forms*    Zero or more forms

*results*        The values returned by evaluating *form*, the values returned by evaluating the last *handler-form* form or the last *error-form* form, or no values

## Returns

The values returned by evaluating *form* unless an error occurs during that evaluation in which case:

- the values of evaluating the last *error-form* form, if specified, are returned
- otherwise, the values of evaluating the last *handler-form* form, if specified, are returned
- otherwise, no values are returned

## Description

If an error occurs while evaluating *form*, each *handler-form* is evaluated in the dynamic context of the error, then the dynamic context is unwound to that in which *form* was evaluated and each *error-form* is evaluated.

A lexical function, **error-message**, is available for use within each *handler-form* and *error-form*. This lexical function accepts no arguments and returns a string describing the error that occurred during the evaluation of *form*.

Another lexical function, **error-condition**, is also available for use within each *handler-form* and *nobrrror-form*. This lexical function accepts no arguments and returns the condition object that signaled the error.

The conditions that are handled can be changed by using the (:conditions *type*) option. Unlike other Common Lisp implementations, [Allegro CL](#) includes interrupt signals (typically generated by the user typing control-C characters in the REPL) as error conditions. Interrupt signals are excluded by default on Allegro CL.

**\*disable-with-error-handling\*** (page [64](#))

## Examples

```

> (with-error-handling (values 1 2 3) ' :error-occurred)
1
2
3
> (with-error-handling (values 1 2 (error "Bad")) ' :error-occurred)
:error-occurred
> (with-error-handling (values 1 2 (/ 10 0)) (printv (error-message)) nil)
;; (error-message) => "Attempt to divide 10 by zero."
nil
> (defparameter ** 0)
**
> (with-error-handling
  ((let (** 1)
    (error "A silly error has occurred.")
    (printv "Handler form" (error-message) **)
    (values :c :b :a))
   (printv "Error form" (error-message) **)
   (values :a :b :c))
  ;; Handler form
  ;; (error-message) => "A silly error has occurred."
  ;; ** => 1
  ;; Error form
  ;; (error-message) => "A silly error has occurred."
  ;; ** => 0
  :a
  :b
  :c)
> (with-error-handling
  ((let (** 1)
    (error "A silly error has occurred.")
    (printv "Handler form" (error-message) **)
    (values :c :b :a)))
   ; No error forms
  ;; Handler form
  ;; (error-message) => "A silly error has occurred."
  ;; ** => 1
  :c
  :b
  :a)
> (with-error-handling
  ;; No handler-forms:
  ((let (** 1)
    (error "A silly error has occurred."))
   (printv "Error form" (error-message) **)
   (values :a :b :c))
  ;; Error form
  ;; (error-message) => "A silly error has occurred."
  ;; ** => 0
  :a
  :b
  :c)
> (with-error-handling (warn "Not too bad") ' :error-occurred)

```

```
;; Warning: Not too bad
nil
> (with-error-handling ((warn "Not too bad")
                       (:conditions (or (and error
                                           #+allegro
                                           (not interrupt-signal))
                                         warning)))
      :error-occurred)
:error-occurred
>
```

---

**with-error-handling**

---

**with-full-optimization** (*option*\*) *declaration*\* *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Compile *forms* with (speed 3), (safety 0), (debug 0), and (compilation-speed 0) optimization settings.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*option* No options are currently supported

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating *form*.

## Description

This macro provides a convenient means of declaring small code fragments for fastest (and least safe) compiler optimizations. If the feature **:full-safety** is present at compile time, this macro has no effect on optimization settings.

## Examples

Declare a function definition, including argument checking, to be fully optimized for the fastest (and least safe) execution:

```
(with-full-optimization ()
  (defun extent-> (value)
    `(,value ,infinity)))
```

Optimize the same function definition, but this time without invocation and argument-checking optimizations:

```
(defun extent-> (value)
  (with-full-optimization ()
    `(,value ,infinity)))
```

---

---

**with-generate-accessors-format** (*format* [*prefix/suffix-name*]) *form*\*  $\Rightarrow$  *result*\* [Macro]

---

## Purpose

Change the default for accessor names generated by **define-class**, **define-event-class**, **define-space-class**, and **define-unit-class** definitions appearing in *forms*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*format* Either the keyword `:prefix` or `:suffix`

*prefix/suffix-name* One of the following (evaluated):

- A string
- A symbol
- A function designator specifying a function object accepting two arguments, *class-name* and *slot-name*, that returns the complete string to be used for the accessor name

*forms* An implicit **progn** of forms

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Description

If a function object *prefix/suffix-name* is specified, it is called to produce the complete accessor-name string, no matter which *format* value is provided. Otherwise, if `:prefix` is specified as the *format* value, a string or symbol *prefix/suffix-name* is concatenated in front of the slot name to generate the slot-accessor name. If `:suffix` is specified as the *format* value, a string or symbol *prefix/suffix-name* is concatenated after the slot name.

The default *prefix/suffix-name* for `:prefix` is a function that generates historical GBB-style “*class-name . slot-name*” slot accessors; the default for `:suffix` is `' #: -of`.

## See also

**define-class** (page [83](#))

**define-event-class** (page [394](#))

**define-space-class** (page [438](#))

**define-unit-class** (page [330](#))

## Examples

Define three classes, `point`, `circle`, and `rectangle`, generating GBB-style “*class-name . slot-name*” slot accessors:

```
> (with-generate-accessors-format (:prefix)
  (define-class point ()
    (x y)
    (define-class circle (point)
```

```
    (radius))
  (define-class rectangle (point)
    (length width)))
#<standard-class rectangle>
>
```

**Re-define the classes, generating “*slot-name*”-only slot accessors:**

```
> (with-generate-accessors-format (:suffix ""))
  (define-class point ()
    (x y))
  (define-class circle (point)
    (radius))
  (define-class rectangle (point)
    (length width)))
#<standard-class rectangle>
>
```

**Re-define the classes, generating “*slot-name-of-class-name*” slot accessors (note that the `strange-name-string` name-generation function must be available at compile time):**

```
> (eval-when (:compile-toplevel :load-toplevel :execute)
  (defun strange-name-string (class-name slot-name)
    (concatenate 'simple-string
      (symbol-name class-name) "-"
      (symbol-name '#:of) "-"
      (symbol-name slot-name))))
strange-name-string
> (with-generate-accessors-format (:prefix (symbol-function
'strange-name-string))
  (define-class point ()
    (x y))
  (define-class circle (point)
    (radius))
  (define-class rectangle (point)
    (length width)))
#<standard-class rectangle>
>
```

---

**with-generate-accessors-format**

---

**with-gensyms** (*symbol\**) *declaration\** *form\**  $\Rightarrow$  *result\**

---

[*Macro*]

## Purpose

Bind each *symbol* to a gensym symbol.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*symbols* Zero or more symbols to be bound to gensyms

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Examples

```
> (pprint (macroexpand '(with-gensyms (a b) (form))))  
(let ((a (gensym))  
      (b (gensym)))  
  (form))  
>
```

---

**with-once-only-bindings** (*symbol*<sup>\*</sup>) *declaration*<sup>\*</sup> *form*<sup>\*</sup>  $\Rightarrow$  *result*<sup>\*</sup>

---

[*Macro*]

## Purpose

Evaluate, in order, each *symbol* and then make every reference to *symbol* inside each *form* refer to that value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*symbols* Zero or more symbols to be evaluated once only  
*declaration* A declare expression (not evaluated)  
*forms* An implicit **progn** of forms to be evaluated  
*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Description

This is GBBopen's version of the "once-only" macro-writing macro that ensures that the forms associated with macro arguments are only evaluated once and in the specified order.

## Example

```
(define-compiler-macro ensure-list (x)
  (with-once-only-bindings (x)
    `(if (listp ,x) ,x (list ,x))))
```

---

**xor** &rest *args* ⇒ *boolean*

---

[*Function*]

## Purpose

Return the exclusive or (XOR) of zero or more arguments.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*arg* A generalized boolean (an object)

*boolean* A generalized boolean

## Returns

True if there are an even odd number of true arguments; `nil` otherwise.

## Examples

```
> (xor)
nil
> (xor nil nil)
nil
> (xor 't 't)
nil
> (xor nil 't)
t
> (xor 't nil)
t
> (xor nil 't nil 't 't nil)
t
>
```

---

### 3.1 CLOS and MOP

The GBBopen Tools module imports commonly used CLOS and MOP symbols into the `:gbbopen-tools` package and then exports them, making it easy to use CLOS and MOP entities (without worrying about each Common Lisp implementation's package structure) by simply using the `:gbbopen-tools` package. The following CLOS and MOP symbols are exported by `:gbbopen-tools`:

```
accessor-method-slot-definition
add-dependent
add-direct-method
add-direct-subclass
class-default-initargs
class-direct-default-initargs
class-direct-slots
class-direct-subclasses
class-direct-superclasses

**Load-time warning messages are displayed if the Common Lisp implementation does not have one of these symbols in its CLOS or MOP implementation.**

## 3.2 Declared Numerics

The `:gbbopen-tools` module contains a set of declared-numeric and pseudo probability (see page 149) operators that provide convenient shorthands for declaring `fixnum`, `short-float`, `single-float`, `double-float`, `long-float`, and `pseudo-probability` numeric operations. If the feature `:full-safety` is present at compile time, these operators do not make their `fixnum`, `single-float`, `double-float`, and `long-float` declarations.

The names of the declared-numeric and pseudo-probability operators include these “type-indicator” characters:

Characters	Declared Type
<code>&amp;</code>	<code>fixnum</code>
<code>\$&amp;</code>	<code>short-float</code>
<code>\$</code>	<code>single-float</code>
<code>\$\$</code>	<code>double-float</code>
<code>\$\$\$</code>	<code>long-float</code>
<code>%</code>	<code>pseudo-probability</code>

Thus, the declared-numeric + operators are:

<code>+&amp;</code>	<code>fixnum addition</code>
<code>+\$&amp;</code>	<code>short-float addition</code>
<code>+\$</code>	<code>single-float addition</code>
<code>\$\$</code>	<code>double-float addition</code>
<code>\$\$\$</code>	<code>long-float addition</code>
<code>+%</code>	<code>pseudo-probability addition</code>

Most Common Lisp implementations map double-float numbers to the 64-bit [IEEE 754](#) double format and single-float numbers to the 32-bit [IEEE 754](#) single format. The four types of floating-point declared numeric operators (`short-float`, `single-float`, `double-float`, and `long-float`) are always defined, even if the Common Lisp implementation provides fewer distinct internal float representations. The features `:has-short-float`, `:has-single-float`, `:has-double-float`, and `:has-long-float` are added when the implementation provides that distinct internal float representation. (The feature `:has-single-float` is always defined.)

The following two features related to `fixnum` capabilities are defined when appropriate: `:fixnum-size-below-29` and `:fixnum-size-supports-unsigned-byte-32`.

Some examples of declared-numeric operators include:

```
(& x) => (the fixnum x)
(+& x y) => (the fixnum (+ (the fixnum x) (the fixnum y)))
(>$ a b) => (> (the single-float a) (the single-float b))
(minusp$$$ value) => (minusp (the double-float value))
(truncate& x y) => (the (values fixnum fixnum) (truncate (& x) (& y)))
```

The complete set of operators for each declared numeric type are listed in the following sections. (Pseudo probability operators are listed in the Pseudo Probabilities section (see page 149) of the manual.)

---

## Fixnum operators

These `fixnum` declared-numeric operators are defined in the `:gbbopen-tools` module:

Operator	Operation	Example
<code>&amp;</code>	the <code>fixnum</code>	<code>(&amp; x)</code>
<code>+&amp;</code>	<code>+</code>	<code>(+&amp; x y z)</code>
<code>-&amp;</code>	<code>-</code>	<code>(-&amp; x y z)</code>
<code>1+&amp;</code>	<code>1+</code>	<code>(1+&amp; x)</code>
<code>1-&amp;</code>	<code>1-</code>	<code>(1-&amp; x)</code>
<code>*&amp;</code>	<code>*</code>	<code>(*&amp; x y z)</code>
<code>/&amp;</code>	<code>/</code>	<code>(/&amp; x y z)</code>
<code>=&amp;</code>	<code>=</code>	<code>(=&amp; x y z)</code>
<code>/=&amp;</code>	<code>/=</code>	<code>(/=&amp; x y z)</code>
<code>&lt;&amp;</code>	<code>&lt;</code>	<code>(&lt;&amp; x y z)</code>
<code>&lt;=&amp;</code>	<code>&lt;=</code>	<code>(&lt;=&amp; x y z)</code>
<code>&gt;&amp;</code>	<code>&gt;</code>	<code>(&gt;&amp; x y z)</code>
<code>&gt;=&amp;</code>	<code>&gt;=</code>	<code>(&gt;=&amp; x y z)</code>
<code>abs&amp;</code>	<code>abs</code>	<code>(abs&amp; x)</code>
<code>bounded-value&amp;</code>	<code>bounded-value</code>	<code>(bounded-value&amp; x y z)</code>
<code>ceiling&amp;</code>	<code>ceiling</code>	<code>(ceiling&amp; x divisor)</code>
<code>decf&amp;</code>	<code>decf</code>	<code>(decf&amp; x delta)</code>
<code>decf-&amp;after</code>	<code>decf-after</code>	<code>(decf-&amp;after x delta)</code>
<code>decf/delete&amp;-acons</code>	<code>decf/delete-acons</code>	<code>(decf/delete&amp;-acons x delta alist)</code>
<code>evenp&amp;</code>	<code>evenp</code>	<code>(evenp&amp; x)</code>
<code>fceiling&amp;</code>	<code>fceiling</code>	<code>(fceiling&amp; x divisor)</code>
<code>floor&amp;</code>	<code>floor</code>	<code>(floor&amp; x divisor)</code>
<code>ffloor&amp;</code>	<code>ffloor</code>	<code>(ffloor&amp; x divisor)</code>
<code>fround&amp;</code>	<code>fround</code>	<code>(fround&amp; x divisor)</code>
<code>ftruncate&amp;</code>	<code>ftruncate</code>	<code>(ftruncate&amp; x divisor)</code>
<code>incf&amp;</code>	<code>incf</code>	<code>(incf&amp; x delta)</code>
<code>incf-&amp;after</code>	<code>incf-after</code>	<code>(incf-&amp;after x delta)</code>
<code>max&amp;</code>	<code>max</code>	<code>(max&amp; x y z)</code>
<code>min&amp;</code>	<code>min</code>	<code>(min&amp; x y z)</code>
<code>minusp&amp;</code>	<code>minusp</code>	<code>(minusp&amp; x)</code>
<code>mod&amp;</code>	<code>mod</code>	<code>(mod&amp; x divisor)</code>
<code>oddp&amp;</code>	<code>oddp</code>	<code>(oddp&amp; x)</code>
<code>plusp&amp;</code>	<code>plusp</code>	<code>(plusp&amp; x)</code>
<code>pushnew/incf&amp;-acons</code>	<code>pushnew/incf-acons</code>	<code>(pushnew/incf&amp;-acons 'x delta alist)</code>
<code>round&amp;</code>	<code>round</code>	<code>(round&amp; x divisor)</code>
<code>truncate&amp;</code>	<code>truncate</code>	<code>(truncate&amp; x divisor)</code>
<code>zerop&amp;</code>	<code>zerop</code>	<code>(zerop&amp; x)</code>

The one-argument function `coerce&` provides convenient `fixnum` coercion:

```
(setf x (coerce& x))
```

Although `(coerce x 'fixnum)` is not permitted in Common Lisp, `(coerce& x)` is equivalent to `(truncate x)` when the remainder is zero and the returned quotient is a `fixnum`. Otherwise, `(coerce& x)` signals an error.

---

## Short-float operators

These short-float declared-numeric operators are defined in the `:gbbopen-tools` module:

Operator	Operation	Example
<code>\$&amp;</code>	the short-float	<code>(\$&amp; x)</code>
<code>+\$&amp;</code>	<code>+</code>	<code>(+\$&amp; x y z)</code>
<code>-\$&amp;</code>	<code>-</code>	<code>(-\$&amp; x y z)</code>
<code>1+\$&amp;</code>	<code>1+</code>	<code>(1+\$&amp; x)</code>
<code>1-\$&amp;</code>	<code>1-</code>	<code>(1-\$&amp; x)</code>
<code>*\$&amp;</code>	<code>*</code>	<code>(*\$&amp; x y z)</code>
<code>/\$&amp;</code>	<code>/</code>	<code>(/\$&amp; x y z)</code>
<code>=\$&amp;</code>	<code>=</code>	<code>(=\$&amp; x y z)</code>
<code>/=\$&amp;</code>	<code>/=</code>	<code>(/=\$&amp; x y z)</code>
<code>&lt;\$&amp;</code>	<code>&lt;</code>	<code>(&lt;\$&amp; x y z)</code>
<code>&lt;=\$&amp;</code>	<code>&lt;=</code>	<code>(&lt;=\$&amp; x y z)</code>
<code>&gt;\$&amp;</code>	<code>&gt;</code>	<code>(&gt;\$&amp; x y z)</code>
<code>&gt;=\$&amp;</code>	<code>&gt;=</code>	<code>(&gt;=\$&amp; x y z)</code>
<code>abs\$&amp;</code>	<code>abs</code>	<code>(abs\$&amp; x)</code>
<code>bounded-value\$&amp;</code>	<code>bounded-value</code>	<code>(bounded-value\$&amp; x y z)</code>
<code>ceiling\$&amp;</code>	<code>ceiling</code>	<code>(ceiling\$&amp; x divisor)</code>
<code>decf\$&amp;</code>	<code>decf</code>	<code>(decf\$&amp; x delta)</code>
<code>decf-\$&amp;after</code>	<code>decf-after</code>	<code>(decf\$&amp;-after x delta)</code>
<code>decf/delete\$&amp;-acons</code>	<code>decf/delete-acons</code>	<code>(decf/delete\$&amp;-acons x delta alist)</code>
<code>evenp\$&amp;</code>	<code>evenp</code>	<code>(evenp\$&amp; x)</code>
<code>fceiling\$&amp;</code>	<code>fceiling</code>	<code>(fceiling\$&amp; x divisor)</code>
<code>floor\$&amp;</code>	<code>floor</code>	<code>(floor\$&amp; x divisor)</code>
<code>ffloor\$&amp;</code>	<code>ffloor</code>	<code>(ffloor\$&amp; x divisor)</code>
<code>fround\$&amp;</code>	<code>fround</code>	<code>(fround\$&amp; x divisor)</code>
<code>ftruncate\$&amp;</code>	<code>ftruncate</code>	<code>(ftruncate\$&amp; x divisor)</code>
<code>incf\$&amp;</code>	<code>incf</code>	<code>(incf\$&amp; x delta)</code>
<code>incf-\$&amp;after</code>	<code>incf-after</code>	<code>(incf\$&amp;-after x delta)</code>
<code>max\$&amp;</code>	<code>max</code>	<code>(max\$&amp; x y z)</code>
<code>min\$&amp;</code>	<code>min</code>	<code>(min\$&amp; x y z)</code>
<code>minusp\$&amp;</code>	<code>minusp</code>	<code>(minusp\$&amp; x)</code>
<code>mod\$&amp;</code>	<code>mod</code>	<code>(mod\$&amp; x divisor)</code>
<code>oddp\$&amp;</code>	<code>oddp</code>	<code>(oddp\$&amp; x)</code>
<code>plusp\$&amp;</code>	<code>plusp</code>	<code>(plusp\$&amp; x)</code>
<code>pushnew/incf\$&amp;-acons</code>	<code>pushnew/incf-acons</code>	<code>(pushnew/incf\$&amp;-acons 'x delta alist)</code>
<code>round\$&amp;</code>	<code>round</code>	<code>(round\$&amp; x divisor)</code>
<code>truncate\$&amp;</code>	<code>truncate</code>	<code>(truncate\$&amp; x divisor)</code>
<code>zerop\$&amp;</code>	<code>zerop</code>	<code>(zerop\$&amp; x)</code>

The one-argument function **`coerce$&`** provides convenient short-float coercion:

```
(setf x (coerce$& x))
```

---

## Single-float operators

These single-float declared-numeric operators are defined in the `:gbbopen-tools` module:

Operator	Operation	Example
<code>\$</code>	the single-float	<code>(\$ x)</code>
<code>+\$</code>	<code>+</code>	<code>(+\$ x y z)</code>
<code>-\$</code>	<code>-</code>	<code>(-\$ x y z)</code>
<code>1+\$</code>	<code>1+</code>	<code>(1+\$ x)</code>
<code>1-\$</code>	<code>1-</code>	<code>(1-\$ x)</code>
<code>*\$</code>	<code>*</code>	<code>(*\$ x y z)</code>
<code>/\$</code>	<code>/</code>	<code>(\$ x y z)</code>
<code>=\$</code>	<code>=</code>	<code>(=\$ x y z)</code>
<code>/=\$</code>	<code>/=</code>	<code>(/=\$ x y z)</code>
<code>&lt;\$</code>	<code>&lt;</code>	<code>(&lt;\$ x y z)</code>
<code>&lt;=\$</code>	<code>&lt;=</code>	<code>(&lt;=\$ x y z)</code>
<code>&gt;\$</code>	<code>&gt;</code>	<code>(&gt;\$ x y z)</code>
<code>&gt;=\$</code>	<code>&gt;=</code>	<code>(&gt;=\$ x y z)</code>
<code>abs\$</code>	<code>abs</code>	<code>(abs\$ x)</code>
<code>bounded-value\$</code>	<code>bounded-value</code>	<code>(bounded-value\$ x y z)</code>
<code>ceiling\$</code>	<code>ceiling</code>	<code>(ceiling\$ x divisor)</code>
<code>decf\$</code>	<code>decf</code>	<code>(decf\$ x delta)</code>
<code>decf-\$after</code>	<code>decf-after</code>	<code>(decf\$-after x delta)</code>
<code>decf/delete\$-acons</code>	<code>decf/delete-acons</code>	<code>(decf/delete\$-acons x delta alist)</code>
<code>evenp\$</code>	<code>evenp</code>	<code>(evenp\$ x)</code>
<code>fceiling\$</code>	<code>fceiling</code>	<code>(fceiling\$ x divisor)</code>
<code>floor\$</code>	<code>floor</code>	<code>(floor\$ x divisor)</code>
<code>ffloor\$</code>	<code>ffloor</code>	<code>(ffloor\$ x divisor)</code>
<code>fround\$</code>	<code>fround</code>	<code>(fround\$ x divisor)</code>
<code>ftruncate\$</code>	<code>ftruncate</code>	<code>(ftruncate\$ x divisor)</code>
<code>incf\$</code>	<code>incf</code>	<code>(incf\$ x delta)</code>
<code>incf\$-after</code>	<code>incf-after</code>	<code>(incf\$-after x delta)</code>
<code>max\$</code>	<code>max</code>	<code>(max\$ x y z)</code>
<code>min\$</code>	<code>min</code>	<code>(min\$ x y z)</code>
<code>minusp\$</code>	<code>minusp</code>	<code>(minusp\$ x)</code>
<code>mod\$</code>	<code>mod</code>	<code>(mod\$ x divisor)</code>
<code>oddp\$</code>	<code>oddp</code>	<code>(oddp\$ x)</code>
<code>plusp\$</code>	<code>plusp</code>	<code>(plusp\$ x)</code>
<code>pushnew/incf\$-acons</code>	<code>pushnew/incf-acons</code>	<code>(pushnew/incf\$-acons 'x delta alist)</code>
<code>round\$</code>	<code>round</code>	<code>(round\$ x divisor)</code>
<code>truncate\$</code>	<code>truncate</code>	<code>(truncate\$ x divisor)</code>
<code>zerop\$</code>	<code>zerop</code>	<code>(zerop\$ x)</code>

The one-argument function **`coerce$`** provides convenient single-float coercion:

```
(setf x (coerce$ x))
```

---

## Double-float operators

These double-float declared-numeric operators are defined in the `:gbbopen-tools` module:

Operator	Operation	Example
<code>\$\$</code>	the double-float	<code>(\$\$ x)</code>
<code>+\$</code>	<code>+</code>	<code>(+\$ x y z)</code>
<code>-\$</code>	<code>-</code>	<code>(-\$ x y z)</code>
<code>1+\$</code>	<code>1+</code>	<code>(1+\$ x)</code>
<code>1-\$</code>	<code>1-</code>	<code>(1-\$ x)</code>
<code>*\$</code>	<code>*</code>	<code>(*\$ x y z)</code>
<code>/\$</code>	<code>/</code>	<code>(\$\$ x y z)</code>
<code>=\$</code>	<code>=</code>	<code>(=\$\$ x y z)</code>
<code>/=\$</code>	<code>/=</code>	<code>(/=\$\$ x y z)</code>
<code>&lt;\$</code>	<code>&lt;</code>	<code>(&lt;\$ x y z)</code>
<code>&lt;=\$</code>	<code>&lt;=</code>	<code>(&lt;=\$\$ x y z)</code>
<code>&gt;\$</code>	<code>&gt;</code>	<code>(&gt;\$ x y z)</code>
<code>&gt;=\$</code>	<code>&gt;=</code>	<code>(&gt;=\$\$ x y z)</code>
<code>abs\$\$</code>	<code>abs</code>	<code>(abs\$\$ x)</code>
<code>bounded-value\$\$</code>	<code>bounded-value</code>	<code>(bounded-value\$\$ x y z)</code>
<code>ceiling\$\$</code>	<code>ceiling</code>	<code>(ceiling\$\$ x divisor)</code>
<code>decf\$\$</code>	<code>decf</code>	<code>(decf\$\$ x delta)</code>
<code>decf-\$\$after</code>	<code>decf-after</code>	<code>(decf\$\$-after x delta)</code>
<code>decf/delete\$\$-acons</code>	<code>decf/delete-acons</code>	<code>(decf/delete\$\$-acons x delta alist)</code>
<code>evenp\$\$</code>	<code>evenp</code>	<code>(evenp\$\$ x)</code>
<code>fceiling\$\$</code>	<code>fceiling</code>	<code>(fceiling\$\$ x divisor)</code>
<code>floor\$\$</code>	<code>floor</code>	<code>(floor\$\$ x divisor)</code>
<code>ffloor\$\$</code>	<code>ffloor</code>	<code>(ffloor\$\$ x divisor)</code>
<code>fround\$\$</code>	<code>fround</code>	<code>(fround\$\$ x divisor)</code>
<code>ftruncate\$\$</code>	<code>ftruncate</code>	<code>(ftruncate\$\$ x divisor)</code>
<code>incf\$\$</code>	<code>incf</code>	<code>(incf\$\$ x delta)</code>
<code>incf\$\$-after</code>	<code>incf-after</code>	<code>(incf\$\$-after x delta)</code>
<code>max\$\$</code>	<code>max</code>	<code>(max\$\$ x y z)</code>
<code>min\$\$</code>	<code>min</code>	<code>(min\$\$ x y z)</code>
<code>minusp\$\$</code>	<code>minusp</code>	<code>(minusp\$\$ x)</code>
<code>mod\$\$</code>	<code>mod</code>	<code>(mod\$\$ x divisor)</code>
<code>oddp\$\$</code>	<code>oddp</code>	<code>(oddp\$\$ x)</code>
<code>plusp\$\$</code>	<code>plusp</code>	<code>(plusp\$\$ x)</code>
<code>pushnew/incf\$\$-acons</code>	<code>pushnew/incf-acons</code>	<code>(pushnew/incf\$\$-acons 'x delta alist)</code>
<code>round\$\$</code>	<code>round</code>	<code>(round\$\$ x divisor)</code>
<code>truncate\$\$</code>	<code>truncate</code>	<code>(truncate\$\$ x divisor)</code>
<code>zerop\$\$</code>	<code>zerop</code>	<code>(zerop\$\$ x)</code>

The one-argument function `coerce$$` provides convenient double-float coercion:

```
(setf x (coerce$$ x))
```

## Long-float operators

These long-float declared-numeric operators are defined in the `:gbbopen-tools` module:

Operator	Operation	Example
<code>\$\$\$</code>	the long-float	<code>(\$\$\$ x)</code>
<code>+\$\$\$</code>	<code>+</code>	<code>(+\$\$\$ x y z)</code>
<code>-\$\$\$</code>	<code>-</code>	<code>(-\$\$\$ x y z)</code>
<code>1+\$\$\$</code>	<code>1+</code>	<code>(1+\$\$\$ x)</code>
<code>1-\$\$\$</code>	<code>1-</code>	<code>(1-\$\$\$ x)</code>
<code>*\$\$\$</code>	<code>*</code>	<code>(*\$\$\$ x y z)</code>
<code>/\$\$\$</code>	<code>/</code>	<code>(/\$\$\$ x y z)</code>
<code>=\$\$\$</code>	<code>=</code>	<code>(=\$\$\$ x y z)</code>
<code>/=\$\$\$</code>	<code>/=</code>	<code>(/=\$\$\$ x y z)</code>
<code>&lt;\$\$\$</code>	<code>&lt;</code>	<code>(&lt;\$\$\$ x y z)</code>
<code>&lt;=\$\$\$</code>	<code>&lt;=</code>	<code>(&lt;=\$\$\$ x y z)</code>
<code>&gt;\$\$\$</code>	<code>&gt;</code>	<code>(&gt;\$\$\$ x y z)</code>
<code>&gt;=\$\$\$</code>	<code>&gt;=</code>	<code>(&gt;=\$\$\$ x y z)</code>
<code>abs\$\$\$</code>	<code>abs</code>	<code>(abs\$\$\$ x)</code>
<code>bounded-value\$\$\$</code>	<code>bounded-value</code>	<code>(bounded-value\$\$\$ x y z)</code>
<code>ceiling\$\$\$</code>	<code>ceiling</code>	<code>(ceiling\$\$\$ x divisor)</code>
<code>decf\$\$\$</code>	<code>decf</code>	<code>(decf\$\$\$ x delta)</code>
<code>decf-\$\$\$after</code>	<code>decf-after</code>	<code>(decf\$\$\$-after x delta)</code>
<code>decf/delete\$\$\$-acons</code>	<code>decf/delete-acons</code>	<code>(decf/delete\$\$\$-acons x delta alist)</code>
<code>evenp\$\$\$</code>	<code>evenp</code>	<code>(evenp\$\$\$ x)</code>
<code>fceiling\$\$\$</code>	<code>fceiling</code>	<code>(fceiling\$\$\$ x divisor)</code>
<code>floor\$\$\$</code>	<code>floor</code>	<code>(floor\$\$\$ x divisor)</code>
<code>ffloor\$\$\$</code>	<code>ffloor</code>	<code>(ffloor\$\$\$ x divisor)</code>
<code>fround\$\$\$</code>	<code>fround</code>	<code>(fround\$\$\$ x divisor)</code>
<code>ftruncate\$\$\$</code>	<code>ftruncate</code>	<code>(ftruncate\$\$\$ x divisor)</code>
<code>incf\$\$\$</code>	<code>incf</code>	<code>(incf\$\$\$ x delta)</code>
<code>incf\$\$\$-after</code>	<code>incf-after</code>	<code>(incf\$\$\$-after x delta)</code>
<code>max\$\$\$</code>	<code>max</code>	<code>(max\$\$\$ x y z)</code>
<code>min\$\$\$</code>	<code>min</code>	<code>(min\$\$\$ x y z)</code>
<code>minusp\$\$\$</code>	<code>minusp</code>	<code>(minusp\$\$\$ x)</code>
<code>mod\$\$\$</code>	<code>mod</code>	<code>(mod\$\$\$ x divisor)</code>
<code>oddp\$\$\$</code>	<code>oddp</code>	<code>(oddp\$\$\$ x)</code>
<code>plusp\$\$\$</code>	<code>plusp</code>	<code>(plusp\$\$\$ x)</code>
<code>pushnew/incf\$\$\$-acons</code>	<code>pushnew/incf-acons</code>	<code>(pushnew/incf\$\$\$-acons 'x delta alist)</code>
<code>round\$\$\$</code>	<code>round</code>	<code>(round\$\$\$ x divisor)</code>
<code>truncate\$\$\$</code>	<code>truncate</code>	<code>(truncate\$\$\$ x divisor)</code>
<code>zerop\$\$\$</code>	<code>zerop</code>	<code>(zerop\$\$\$ x)</code>

The one-argument function `coerce$$$` provides convenient long-float coercion:

```
(setf x (coerce$$$ x))
```

### 3.3 Pseudo Probabilities

The `:gbbopen-tools` module provides a discretized `fixnum` representation for probability values in which probability values in the range `[0.0..1.0]` are represented as the nearest integers in the range `[0..1000]`.

The following pseudo-probability operators are provided:

Operator	Operation	Example
<code>%</code>	the pseudo-probability	<code>(% x)</code>
<code>+%</code>	<code>+&amp;</code>	<code>(+% x y z)</code>
<code>-%</code>	<code>-&amp;</code>	<code>(-% x y z)</code>
<code>1+%</code>	<code>1+&amp;</code>	<code>(1+% x)</code>
<code>1-%</code>	<code>1-&amp;</code>	<code>(1-% x)</code>
<code>*%</code>	<b>normalizing</b> <code>*&amp;</code>	<code>(*% x y z)</code>
<code>/%</code>	<b>normalizing</b> <code>/&amp;</code>	<code>(/% x y z)</code>
<code>=%</code>	<code>=&amp;</code>	<code>(=% x y z)</code>
<code>/=%</code>	<code>/=&amp;</code>	<code>(/=% x y z)</code>
<code>&lt;%</code>	<code>&lt;&amp;</code>	<code>(&lt;% x y z)</code>
<code>&lt;=%</code>	<code>&lt;=&amp;</code>	<code>(&lt;=% x y z)</code>
<code>&gt;%</code>	<code>&gt;&amp;</code>	<code>(&gt;% x y z)</code>
<code>&gt;=%</code>	<code>&gt;=&amp;</code>	<code>(&gt;=% x y z)</code>
<code>abs%</code>	<code>abs&amp;</code>	<code>(abs% x)</code>
<code>bounded-value%</code>	<code>bounded-value&amp;</code>	<code>(bounded-value% x y z)</code>
<code>ceiling%</code>	<b>normalizing</b> <code>ceiling&amp;</code>	<code>(ceiling% x divisor)</code>
<code>decf%</code>	<code>decf&amp;</code>	<code>(decf% x delta)</code>
<code>decf-%after</code>	<code>decf-after&amp;</code>	<code>(decf%-after x delta)</code>
<code>decf/delete%-acons</code>	<code>decf/delete-acons&amp;</code>	<code>(decf/delete%-acons x delta alist)</code>
<code>evenp%</code>	<code>evenp&amp;</code>	<code>(evenp% x)</code>
<code>fceiling%</code>	<b>normalizing</b> <code>fceiling&amp;</code>	<code>(fceiling% x divisor)</code>
<code>floor%</code>	<b>normalizing</b> <code>floor&amp;</code>	<code>(floor% x divisor)</code>
<code>ffloor%</code>	<b>normalizing</b> <code>ffloor&amp;</code>	<code>(ffloor% x divisor)</code>
<code>fround%</code>	<b>normalizing</b> <code>fround&amp;</code>	<code>(fround% x divisor)</code>
<code>ftruncate%</code>	<b>normalizing</b> <code>ftruncate&amp;</code>	<code>(ftruncate% x divisor)</code>

---

*\*% pseudo-probability\** ⇒ *pseudo-probability-product*

---

[Function]

## Purpose

Returns the product of *numbers*, performing pseudo-probability-normalization in the process.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*pseudo-probability* A `fixnum` pseudo-probability

*pseudo-probability-product* A `fixnum` pseudo-probability

## Returns

The `fixnum` pseudo-probability product of *numbers* or 1000 if no *numbers* are supplied.

## See also

*/%* (page [151](#))

**pprob2prob** (page [155](#))

**prob2pprob** (page [156](#))

## Examples

```
> (* 0.6 0.7)
0.42000002
> (*% 600 700)
420
> (* 0.6 0.7 0.8)
0.33600003
> (*% 600 700 800)
336
> (*%)
1000
>
```

---

*/%* *pseudo-probability-numerator pseudo-probability-denominator*\*  $\Rightarrow$  *quotient*

---

[Function]

## Purpose

Returns the quotient of dividing *pseudo-probability-numerator* by all of the *pseudo-probability-denominators*, performing pseudo-probability-normalization in the process.

## Alternate syntax

*/%* *pseudo-probability-numerator*  $\Rightarrow$  *reciprocal*

**Package** : `gbbopen-tools`

**Module** : `gbbopen-tools`

## Arguments

*pseudo-probability-numerator* A `fixnum` pseudo-probability

*pseudo-probability-denominator* A `fixnum` pseudo-probability

*quotient* A pseudo-probability-normalized `fixnum`

*reciprocal* A pseudo-probability-normalized `fixnum`

## Returns

The pseudo-probability-normalized `fixnum` *quotient* (if one or more *pseudo-probability-denominators* is specified; otherwise the pseudo-probability-normalized `fixnum` *reciprocal* of *pseudo-probability-numerator*).

## Description

pseudo-probability-normalization is performed by */%*, but the `fixnum` result may not be a pseudo-probability. It is an error to specify more than one *pseudo-probability-denominator* value that leads to an intermediate result that is larger than a `fixnum`.

---

**exp%** *pseudo-probability-ln* ⇒ *pseudo-probability*

---

[Function]

## Purpose

Return the “pseudo natural logarithm” (*pseudo-probability-ln*) of a *pseudo-probability* value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*pseudo-probability* A *fixnum* *pseudo-probability*

*pseudo-probability-ln* A *fixnum* *pseudo-probability-ln*

## Returns

The *fixnum* *pseudo-probability-ln* of *pseudo-probability*.

## See also

0.0
> (pprob2prob 1000)
1.0
> (pprob2prob 800)
0.8
>
```

---

**prob2pprob** *probability* ⇒ *pseudo-probability*

---

[*Function*]

### Purpose

Returns the value of *probability* as a pseudo-probability.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*probability* A [0.0..1.0] probability

*pseudo-probability* A fixnum pseudo-probability

### Returns

The converted *pseudo-probability*.

### See also

**pprob2prob** (page [155](#))

### Examples

```
> (prob2pprob 0.0)
0
> (prob2pprob 1.0)
1000
> (prob2pprob 0.8)
800
>
```

### 3.4 Date and Time

The `:gbbopen-tools` module includes useful date and time parsing and formatting entities.

In addition to UTC offsets, time-of-day entities support the following time-zone abbreviations for standard-time (non-daylight-savings) offsets:

Offset	Zone	Locations
1	WAT	West Africa (also Cape Verdes Islands, Atlantic Ocean)
2	AT	Azores
7/2	NST	Newfoundland
4	AST	Atlantic
5	EST	Eastern (North America)
6	CST	Central (North America)
7	MST	Mountain (North America)
8	PST	Pacific (North America)
9	AKST	Alaska
10	HAST	Hawaii-Aleutian
11	NT	Nome
12	IDLW	International Dateline West
0	GMT	Greenwich (also Portugal, Reykjavik (Iceland), Western Africa)
-1	CET	Central European (also Algeria, Nigeria, Angola)
-2	EET	Eastern European (also Finland, Balkans, Libya, Egypt, South Africa)
-3	MSK	Moscow (also Baghdad, Eastern Africa, Ethiopia, Kenya, Tanzania)
-4	ZP4	Samara (Russia Zone 3)
-5	ZP5	Yekaterinburg (Russia Zone 4)
-11/2	IST	Indian
-6	ZP6	Omsk (Russia Zone 5), Bangladesh)
-7	WAST	West Australian Standard (also Christmas Island, Krasnoyarsk (Russia Zone 6), Western Indonesia)
-8	AWST	Australian Western (also Irkutsk (Russia Zone 7), China, Hong Kong, Philippines, Central Indonesia)
-9	JST	Japan (also Yakutsk (Russia Zone 8), Korea, Eastern Indonesia)
-19/2	ACST	Australian Central
-10	AEST	Australian Eastern (also Vladivostok (Russia Zone 9), Papua New Guinea)
-21/2	NFT	Norfolk (Island)
-12	NZST	New Zealand (also Kamchatka (Russia), Fiji, Marshall Islands)

and for daylight-savings-time offsets:

Offset	Zone	Locations
5/2	NDT	Newfoundland Daylight
3	ADT	Atlantic Daylight
4	EDT	Eastern Daylight (North America)
5	CDT	Central Daylight (North America)
6	MDT	Mountain Daylight (North America)
7	PDT	Pacific Daylight (North America)
8	AKDT	Alaska Daylight
9	HADT	Hawaii-Aleutian Daylight
-1	BST	British Summer
-2	CEDT	Central European Daylight
-3	EEDT	Eastern European Daylight
-4	MSD	Moscow Daylight
-9	AWDT	Australian Western Daylight
-21/2	ACSD	Australian Central Daylight
-11	AEDT	Australian Eastern Daylight

Time-zone abbreviations used around the world are not unique or universal. The same hour offset can map onto multiple different zone abbreviations, and the same abbreviations are also used to refer to different zones. The above choices of supported abbreviations were made arbitrarily, and the use of UTC offsets is recommended for unambiguous textual representation of the time of day.

---

**\*month-precedes-date\***

[*Variable*]

---

## Purpose

Control the default month and date ordering for GBBopen Tools date and time entities.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

**Value type** A generalized boolean

**Initial value** True

## See also

**brief-date** (page [161](#))

**brief-date-and-time** (page [163](#))

**encode-date-and-time** (page [168](#))

**full-date-and-time** (page [172](#))

**parse-date** (page [181](#))

**parse-date-and-time** (page [184](#))

**parse-time** (page [190](#))

**very-brief-date** (page [195](#))

## Examples

Toggle between date formatting options:

```
> (let ((*month-precedes-date* 't))
    (brief-date-and-time))
"Feb 16 13:11"
> (let ((*month-precedes-date* nil))
    (brief-date-and-time))
"16 Feb 13:11"
>
```

## Note

This variable is defined in the :module-manager module in order to make it available as early as possible.

---

---

**\*time-first\***

[Variable]

---

## Purpose

Control the default date and time ordering for GBBopen Tools date and time entities.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A generalized boolean

**Initial value** nil

## See also

**encode-date-and-time** (page [168](#))

**parse-date-and-time** (page [184](#))

## Example

Change the default date and time ordering to have the time precede the date:

```
> (let ((*time-first* 't)
      (parse-date-and-time "10:30pm 4/1/10"))
  0
  30
  22
  1
  4
  2010
  nil
  nil
  14
  >
```

---

---

**\*year-first\***

[*Variable*]

---

## Purpose

Control the default year positioning for GBBopen Tools date entities.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A generalized boolean

**Initial value** nil

## See also

**brief-date** (page [161](#))

**brief-date-and-time** (page [163](#))

**encode-date-and-time** (page [168](#))

**full-date-and-time** (page [172](#))

**parse-date** (page [181](#))

**parse-date-and-time** (page [184](#))

**very-brief-date** (page [195](#))

## Example

Change the default year positioning to have the year first:

```
> (let ((*year-first* 't))
    (full-date-and-time nil :all-numeric 't :year-first 't))
"2009/02/16 13:11"
> (let ((*year-first* 't))
    (parse-date "1-4-10" :year-first 't))
10
4
2001
6
>
```

---

**brief-date** &optional *universal-time* &key *time-zone month-precedes-date year-first* [Function]  
*include-year destination* ⇒ *result*

---

## Purpose

Generate a brief date description.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

## Arguments

*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

*time-zone* A time zone (default is `nil`, which is equivalent to the current time zone adjusted for daylight saving time)

*month-precedes-date* A generalized boolean (default is **\*month-precedes-date\***)

*year-first* A generalized boolean (default is **\*year-first\***)

*include-year* A generalized boolean (default is `t`)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

A 12-character description is generated (6 characters, if *include-year* is non-`nil`).

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

If *time-zone* is not supplied or is `nil`, it defaults to the current time zone adjusted for daylight saving time. If *time-zone* is supplied, it is assumed to include any adjustment for daylight saving time.

If *month-precedes-date* is true, the month is presented in front of the date; otherwise the date precedes the month.

If *year-first* is supplied and is non-`nil`, the year is presented in front of the month and date; otherwise the year follows the month and date.

If *include-year* is supplied and is non-`nil`, the year is included in the presented time.

## See also

**\*month-precedes-date\*** (page [158](#))

**brief-date-and-time** (page [163](#))

**full-date-and-time** (page [172](#))

**http-date-and-time** (page [176](#))

**internet-text-date-and-time** (page [177](#))

**iso8601-date-and-time** (page [179](#))

**message-log-date-and-time** (page [180](#))

**very-brief-date** (page [195](#))

## Examples

Display the current date (with and without the year):

```
> (brief-date)
"Feb 16, 2008"
> (brief-date (get-universal-time) :include-year nil)
"Feb 16"
>
```

Display the date 10 days ago:

```
> (brief-date (- (get-universal-time) (* 60 60 24 10)))
"Feb 6, 2008"
>
```

## Note

This function is loaded with the `:module-manager` module in order to to make it available as early as possible.

---

**brief-date**

---

**brief-date-and-time** &optional *universal-time* &key *time-zone month-precedes-date* [*Function*]  
*year-first include-seconds destination* ⇒ *result*

---

## Purpose

Generate a brief date-and-time description.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

## Arguments

*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

*time-zone* A time zone (default is `nil`, which is equivalent to the current time zone adjusted for daylight saving time)

*month-precedes-date* A generalized boolean (default is **\*month-precedes-date\***)

*year-first* A generalized boolean (default is **\*year-first\***)

*include-seconds* A generalized boolean (default is `nil`)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

A 12-character description (15 characters, if *include-seconds* is non-`nil`) is generated. If the *universal-time* value is within 120 days of the current time, the result *string* includes the time of day but not the year; otherwise, the year is included but not the time of day.

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

If *time-zone* is not supplied or is `nil`, it defaults to the current time zone adjusted for daylight saving time. If *time-zone* is supplied, it is assumed to include any adjustment for daylight saving time.

If *month-precedes-date* is true, the month is presented in front of the date; otherwise the date precedes the month.

If *year-first* is supplied and is non-`nil`, the year is presented in front of the month and date; otherwise the year follows the month and date.

If *include-seconds* is supplied and is non-`nil`, seconds are included in the presented time.

## See also

**\*month-precedes-date\*** (page [158](#))

**full-date-and-time** (page [172](#))

**http-date-and-time** (page [176](#))

**internet-text-date-and-time** (page [177](#))

**iso8601-date-and-time** (page [179](#))

**message-log-date-and-time** (page [180](#))

**very-brief-date** (page [195](#))

## Examples

Display the current date and time:

```
> (brief-date-and-time)
"Feb 16 13:11"
>
```

Display the current date and time (with seconds):

```
> (brief-date-and-time nil :include-seconds 't)
"Feb 16 13:11:38"
>
```

Display the current date and time as GMT:

```
> (brief-date-and-time nil :time-zone 0)
"Feb 16 18:11"
>
```

The date and time 10 days ago:

```
> (brief-date-and-time (- (get-universal-time) (* 60 60 24 10)))
"Feb  6 13:11"
>
```

The date and time 125 days ago:

```
> (brief-date-and-time (- (get-universal-time) (* 60 60 24 125)))
"Oct 12, 2004"
>
```

The date and time 125 days ago (with seconds, but ignored because no time of day is included for dates that are not within 120 days of the given time):

```
> (brief-date-and-time (- (get-universal-time) (* 60 60 24 125))
:include-seconds 't)
"Oct 12, 2004  "
>
```

## Note

This function is loaded with the `:module-manager` module in order to to make it available as early as possible.

---

## brief-date-and-time

---

**brief-duration** *seconds* &optional *maximum-fields destination* ⇒ *result*

---

[Function]

## Purpose

Format a numeric time duration (in *seconds*) into brief descriptive text.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*seconds* A number  
*maximum-fields* An integer from 1–5 indicating maximum number of fields to include in the descriptive *string* (default is 5, indicating all fields should be included)  
*destination* Either *nil*, *t*, a stream, or a string with a fill pointer (default is *nil*)  
*result* A string or *nil*

## Returns

If *destination* is non-*nil*, then *nil*; otherwise, a string.

## Description

The value of *seconds* is rounded to the nearest 100<sup>th</sup> of a second before conversion. Fields omitted by *maximum-fields* cause appropriate rounding of the generated description.

## See also

**brief-run-time-duration** (page [167](#))

## Examples

```
> (brief-duration 1000)
"16m 40s"
> (brief-duration -1000)
"-16m 40s"
> (brief-duration -1000.12345)
"-16m 40.12s"
> (brief-duration -1000.12543)
"-16m 40.13s"
> (brief-duration 166611.9)
"1d 22h 16m 51.91s"
> (brief-duration 166611.9 4)
"1d 22h 16m 52s"
> (brief-duration 166611.9 3)
"1d 22h 17m"
> (brief-duration 166611.9 2)
"1d 22h"
> (brief-duration 166611.9 1)
"2d"
```

```
> (brief-duration 31556952)
"365d 5h 49m 12s"
>
```

---

**brief-duration**

---

**brief-run-time-duration** *internal-time-units* &optional *maximum-fields destination* [*Function*]  
⇒ *result*

---

## Purpose

Format a run-time duration (in *internal-time-units*) into brief descriptive text.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*internal-time-units* A number

*maximum-fields* An integer from 1–5 indicating maximum number of fields to include in the descriptive *string* (default is 5, indicating all fields should be included)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

The *internal-time-units* run-time duration is rounded to the nearest 100<sup>th</sup> of a second before conversion. Fields omitted by *maximum-fields* cause appropriate rounding of the generated description.

> (brief-run-time-duration most-positive-fixnum)
"6d 5h 7m 50.94s"
>
```

---

**encode-date-and-time** *string* &key *start end junk-allowed date-separators* [Function]  
*time-separators month-precedes-date year-first*  
*default-to-current-year time-first time-zone*  
⇒ *universal-time, pos*

---

## Purpose

Parse and then encode a date-and-time specification string to a Universal Time.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>string</i>	A string
<i>start</i>	Starting index into <i>string</i> (default is 0)
<i>end</i>	Ending index into <i>string</i> (default is nil, meaning end of <i>string</i> )
<i>junk-allowed</i>	A generalized boolean (default is nil)
<i>date-separators</i>	A sequence of characters that are skipped and separate the date, month, and year fields in <i>string</i> , if needed (default is "-/ ,")
<i>time-separators</i>	A sequence of characters that are skipped and separate the hour, minute, and second fields in <i>string</i> , if needed (default is " :")
<i>month-precedes-date</i>	A generalized boolean (default is <b>*month-precedes-date*</b> )
<i>year-first</i>	A generalized boolean (default is <b>*year-first*</b> )
<i>default-to-current-year</i>	A generalized boolean (default is nil)
<i>time-first</i>	A generalized boolean (default is <b>*time-first*</b> )
<i>time-zone</i>	A time zone (default is nil, which is equivalent to the current time zone adjusted for daylight saving time)
<i>universal-time</i>	A Universal Time
<i>position</i>	A index in <i>string</i>

## Returns

Two values: *universal-time* and *position*

## Errors

If *junk-allowed* is false, an error is signaled if a numeric field in *string* does not consist entirely of the representation of an integer, possibly surrounded on either side by characters in *separators*.

## Description

Both the month and date must be specified in *string*, optionally followed by the year and the time of day. The month can be a numeric value (1–12), a three-letter abbreviation, or the full month name. If the month is specified numerically, then the value of *month-precedes-date* is used to determine the month and date ordering. If no year is specified in *string* and *default-to-current-year* is nil, the current calendar year is assumed, unless the specified month and date have passed, in which case the next year is assumed. If no year is specified in *string* and *default-to-current-year* is true, the current calendar year is always assumed. If no hour, minute, or second values are specified, they default to zero.

If *month-precedes-date* is true, the month is expected before the date; otherwise the date is expected to follow the month.

If *year-first* is supplied and is non-*nil*, the year must be provided and it is expected before the month and date; otherwise the year (if provided) is expected to follow the month and date.

If a time-zone is specified in *string*, it is used when encoding the *universal-time* value. Otherwise, if a non-*nil* *time-zone* argument was supplied, it used for the encoding. Otherwise, the current time zone adjusted for daylight saving time is used.

If *time-first* is true, the time-of-day is expected before the date; otherwise the time-of-day is expected to follow the date.

The returned *position* is the index within *string* where the parse ended.

```

### REPL Note

The equivalent of:

```
(print (encode-date-and-time string))
```

can be invoked using the REPL command `:ut string`.

---

### encode-date-and-time

---

**encode-time-of-day** *second minute hour* &optional *universal-time* ⇒ *universal-time* [*Function*]

---

## Purpose

Return a Universal Time representing a specified time-of-day.

**Package** :gbbopen-tools (or :portable-threads if Portable Threads is used without GBBopen Tools)

**Module** :gbbopen-tools (or :portable-threads if Portable Threads is used without GBBopen Tools)

## Arguments

*second* An integer between 0 and 59, inclusive  
*minute* An integer between 0 and 59, inclusive  
*hour* An integer between 0 and 23, inclusive  
*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

## Description

If the specified time-of-date has already passed (relative to the *universal-time* value), the next day is assumed.

## See also

**encode-date-and-time** (page [168](#))

## Examples

Schedule a scheduled function that prints "It's quitting time!" every day at 5pm:

```
> (schedule-function
  (make-scheduled-function
   #'(lambda (scheduled-function)
        (declare (ignore scheduled-function))
        (print "It's quitting time!"))
   :name 'quitting-time)
  (encode-time-of-day 0 0 17) :repeat-interval #.( * 24 60 60))
>
```

Verbosely change quitting-time to 5:30pm every day:

```
> (schedule-function 'quitting-time (encode-time-of-day 0 30 17)
  :repeat-interval #.( * 24 60 60)
  :verbose 't)
;; Unscheduling #<scheduled-function quitting-time [17:00:00]>...
;; Scheduling #<scheduled-function quitting-time [17:30:00]>
;; as the next scheduled-function...
>
```

---

**full-date-and-time** &optional *universal-time* &key *time-zone daylight-savings-p* [Function]  
*all-numeric separator full-names month-precedes-date year-first*  
*include-day include-seconds include-time-zone utc-offset-only*  
*12-hour destination* ⇒ *result*

---

## Purpose

Generate a date-and-time description.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

*time-zone* A time zone (default is `nil`, which is equivalent to the current time zone adjusted for daylight saving time)

*daylight-savings-p* A generalized boolean (default is `nil`)

*all-numeric* A generalized boolean (default is `nil`)

*separator* A character (default is `#\ /`)

*full-names* A generalized boolean (default is `nil`)

*month-precedes-date* A generalized boolean (default is **\*month-precedes-date\***)

*year-first* A generalized boolean (default is **\*year-first\***)

*include-day* A generalized boolean (default is `nil`)

*include-time-zone* A generalized boolean (default is `nil`)

*utc-offset-only* A generalized boolean (default is `nil`)

*12-hour* A generalized boolean (default is `nil`)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

A 17-character description (longer if *full-names*, *include-day*, *include-seconds*, *include-time-zone*, or *utc-offset-only* are non-`nil`) is generated.

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

If *time-zone* is not supplied or is `nil`, it defaults to the current time zone adjusted for daylight saving time. If a *time-zone* is supplied, it is assumed to include any adjustment for daylight saving time unless *daylight-savings-p* is specified and is non-`nil`.

If *all-numeric* is supplied and is non-`nil`, the month is indicated by its numeric value, and the date, month, and year are separated by the *separator* character.

If *full-names* is supplied and is non-`nil`, the full name is generated rather than the abbreviated name for the month (if *include-day* is `nil`) and for the day of the week, (if *include-day* is non-`nil`).

If *month-precedes-date* is true, the month is presented in front of the date; otherwise the date precedes the month.

If *year-first* is supplied and is non-`nil`, the year is presented in front of the month and date; otherwise the year follows the month and date.

If *include-day* is supplied and is non-`nil`, the day of the week is included in front of the date and time.

If *include-seconds* is supplied and is non-`nil`, seconds are included in the presented time.

If either *include-time-zone* or *utc-offset-only* is true, a time-zone specification is appended to the date-and-time presentation. If *utc-offset-only* is true, the time zone is presented as a UTC offset—even if a time-zone abbreviation supported by GBBopen Tools is available for the time zone. If a *time-zone* is supplied, the value of *daylight-savings-p* is used when generating a non-UTC time zone abbreviation; otherwise, the local daylight-savings setting for the *universal-time* value (as determined by `decode-universal-time`) is used, and the *daylight-savings-p* argument is ignored.

If *12-hour* is supplied and is non-`nil`, the time-of-day is presented in AM/PM format.

## Examples

Display the current date and time:

```
> (full-date-and-time)
"Feb 16 2009 13:11"
>
```

Display the current date and time (with seconds):

```
> (full-date-and-time nil :include-seconds 't)
"Feb 16 2009 13:11:38"
>
```

Display the current date and time (with the day of the week):

```
> (full-date-and-time nil :include-day 't)
"Mon Feb 16 2009 13:11"
>
```

Display the current date and time (with no abbreviations and with the day of the week):

```
> (full-date-and-time nil :full-names 't :include-day 't)
"Monday, February 16, 2009 13:11"
>
```

**Display the current date and time (with no abbreviations, with the month following the date, and with the day of the week):**

```
> (full-date-and-time nil :full-names 't :include-day 't
      :month-precedes-date nil)
"Monday, 16 February, 2009 13:11"
>
```

**Display the current date and time (with no abbreviations, with the year first and the month following the date, and with the day of the week):**

```
> (full-date-and-time nil :full-names 't :include-day 't
      :year-first 't :month-precedes-date nil)
"2009, 16 February, Monday 13:11"
>
```

**Display the current date and time (all numeric, with the abbreviated day of the week):**

```
> (full-date-and-time nil :all-numeric 't :include-day 't)
"Mon 02/16/2009 13:11"
>
```

**Display the current date and time (all numeric, with hyphen (minus-sign) separators):**

```
> (full-date-and-time nil :all-numeric 't :separator #)
"02-16-2009 13:11"
>
```

**Display the current date and time (all numeric, with the year first and the abbreviated day of the week):**

```
> (full-date-and-time nil :all-numeric 't :year-first 't :include-day 't)
"2009/02/16 Mon 13:11"
>
```

**Display the current date and time (all numeric, with the month following the date, and with the full day of the week):**

```
> (full-date-and-time nil :all-numeric 't :include-day 't
      :full-names 't :month-precedes-date nil)
"Monday, 16/02/2009 13:11"
>
```

**Display the current date and time (with time zone):**

```
> (full-date-and-time nil :include-time-zone 't)
"Feb 16 2009 13:11 EST"
>
```

**Display the current date and time (in 12-hour format with time zone):**

```
> (full-date-and-time nil :12-hour 't :include-time-zone 't)
"Feb 16 2009 1:11PM EST"
>
```

**Display the current date and time (with UTC-offset time zone):**

```
> (full-date-and-time nil :utc-offset-only 't)
"Feb 16 2009 13:11 UTC-5"
>
```

Display the current date and time (with seconds and time zone):

```
> (full-date-and-time nil
  :include-seconds 't
  :include-time-zone 't)
"Feb 16 2009 13:11:38 EST"
>
```

Display the current date and time as GMT:

```
> (full-date-and-time nil :time-zone 0)
"Feb 16 2009 18:11"
>
```

Display the current date and time as GMT (with time zone):

```
> (full-date-and-time nil
  :time-zone 0
  :include-time-zone 't)
"Feb 16 2009 18:11 GMT"
>
```

The date and time 10 days ago:

```
> (full-date-and-time (- (get-universal-time) (parse-duration "10 days")))
"Feb  6 2009 13:11"
>
```

The date and time 125 days ago:

```
> (full-date-and-time (- (get-universal-time) (parse-duration "125 days")))
"Oct 12 2008 13:11"
>
```

The date and time 125 days ago (with seconds):

```
> (full-date-and-time (- (get-universal-time) (parse-duration "125d"))
  :include-seconds 't)
"Oct 12 2008 13:11:38"
>
```

## REPL Note

The equivalent of:

```
(print (full-date-and-time universal-time
  :include-seconds 't))
```

can be invoked using the REPL command `:ut universal-time`.

---

**http-date-and-time** &optional *universal-time* &key *destination* ⇒ *result*

---

[Function]

## Purpose

Convert a Universal Time value into HTTP/1.1 time-stamp format.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

```

---

**internet-text-date-and-time** &optional *universal-time* &key *time-zone* [Function]  
*daylight-savings-p* *utc-offset-only* *destination* ⇒ *result*

---

## Purpose

Convert a Universal Time value into Internet Text Message format.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>universal-time</i>	A Universal Time (default is <code>nil</code> , which is equivalent to the value returned by <code>(get-universal-time)</code> )
<i>time-zone</i>	A time zone (default is <code>nil</code> , which is equivalent to the current time zone adjusted for daylight saving time)
<i>daylight-savings-p</i>	A generalized boolean (default is <code>nil</code> )
<i>utc-offset-only</i>	A generalized boolean (default is <code>nil</code> )
<i>destination</i>	Either <code>nil</code> , <code>t</code> , a stream, or a string with a fill pointer (default is <code>nil</code> )
<i>result</i>	A string or <code>nil</code>

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

If *utc-offset-only* is true, the time zone is represented as a UTC offset—even if a time-zone abbreviation supported by GBBopen Tools is available for the time zone. If a *time-zone* is supplied, the value of *daylight-savings-p* is used when generating a non-UTC time zone abbreviation; otherwise, the local daylight-savings setting for the *universal-time* value (as determined by `decode-universal-time`) is used, and the *daylight-savings-p* argument is ignored.

```

---

**parse-date** *string* &key *start end junk-allowed separators month-precedes-date year-first default-to-current-year* ⇒ *date, month, year, position* [Function]

---

## Purpose

Parse a date-specification string.

**Package** :gbbopen-tools (home package is :module-manager)

**Module** :module-manager

## Arguments

<i>string</i>	A simple string
<i>start</i>	Starting index into <i>string</i> (default is 0)
<i>end</i>	Ending index into <i>string</i> (default is nil, meaning end of <i>string</i> )
<i>junk-allowed</i>	A generalized boolean (default is nil)
<i>separators</i>	A sequence of characters that are skipped and separate the date, month, and year fields in <i>string</i> , if needed (default is "-/ ,")
<i>month-precedes-date</i>	A generalized boolean (default is <b>*month-precedes-date*</b> )
<i>year-first</i>	A generalized boolean (default is <b>*year-first*</b> )
<i>default-to-current-year</i>	A generalized boolean (default is nil)
<i>date</i>	An integer between 1 and up to 31, inclusive, depending on the month and year
<i>month</i>	An integer between 1 and 12, inclusive
<i>year</i>	An integer
<i>position</i>	A index in <i>string</i>

## Returns

Four values: *date*, *month*, *year*, and *position*

## Errors

If *junk-allowed* is false, an error is signaled if a numeric field in *string* does not consist entirely of the representation of a integer, possibly surrounded on either side by characters in *separators*.

## Description

Both the month and date must be specified in *string*, optionally followed by the year and the time of day. The month can be a numeric value (1–12), a three-letter abbreviation, or the full month name. If the month is specified numerically, then the value of *month-precedes-date* is used to determine the month and date ordering. If no year is specified in *string* and *default-to-current-year* is nil, the current calendar year is assumed, unless the specified month and date have passed, in which case the next year is assumed. If no year is specified in *string* and *default-to-current-year* is true, the current calendar year is always assumed.

The returned *position* is the index within *string* where the parse ended.

**parse-date**

---

**parse-date-and-time** *string* &key *start end junk-allowed date-separators* [Function]  
*time-separators month-precedes-date year-first*  
*default-to-current-year time-first* ⇒ *second, minute, hour, date,*  
*month, year, time-zone, daylight-savings-p, pos*

---

## Purpose

Parse a date-and-time specification string.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>string</i>	A simple string
<i>start</i>	Starting index into <i>string</i> (default is 0)
<i>end</i>	Ending index into <i>string</i> (default is nil, meaning end of <i>string</i> )
<i>junk-allowed</i>	A generalized boolean (default is nil)
<i>date-separators</i>	A sequence of characters that are skipped and separate the date, month, and year fields in <i>string</i> , if needed (default is "-/ ,")
<i>time-separators</i>	A sequence of characters that are skipped and separate the hour, minute, and second fields in <i>string</i> , if needed (default is " :")
<i>month-precedes-date</i>	A generalized boolean (default is <b>*month-precedes-date*</b> )
<i>year-first</i>	A generalized boolean (default is <b>*year-first*</b> )
<i>default-to-current-year</i>	A generalized boolean (default is nil)
<i>time-first</i>	A generalized boolean (default is <b>*time-first*</b> )
<i>second</i>	An integer between 0 and up to 59, inclusive
<i>minute</i>	An integer between 0 and up to 59, inclusive
<i>hour</i>	An integer between 0 and up to 23, inclusive
<i>date</i>	An integer between 1 and up to 31, inclusive, depending on the month and year
<i>month</i>	An integer between 1 and 12, inclusive
<i>year</i>	An integer
<i>time-zone</i>	A time zone: a rational multiple of 1/3600 between -24 and 24 that represents the number of hours offset from GMT
<i>daylight-savings-p</i>	A generalized boolean
<i>position</i>	A index in <i>string</i>

## Returns

Nine values: *second, minute, hour, date, month, year, time-zone, daylight-savings-p*, and *position*

## Errors

If *junk-allowed* is false, an error is signaled if a numeric field in *string* does not consist entirely of the representation of a integer, possibly surrounded on either side by characters in *separators*.

## Description

Both the month and date must be specified in *string*, optionally followed by the year and the time of day. The month can be a numeric value (1–12), a three-letter abbreviation, or the full month name. If the month is specified numerically, then the value of *month-precedes-date* is used to determine the month and date ordering. If no year is specified in *string* and *default-to-current-year* is `nil`, the current calendar year is assumed, unless the specified month and date have passed, in which case the next year is assumed. If no year is specified in *string* and *default-to-current-year* is `true`, the current calendar year is always assumed. If no hour, minute, or second values are specified, they default to zero. The values returned for *time-zone* and *daylight-savings-p* will be `nil` unless a time-zone is specified in *string*.

If *month-precedes-date* is `true`, the month is expected before the date; otherwise the date is expected to follow the month.

If *year-first* is supplied and is non-`nil`, the year must be provided and it is expected before the month and date; otherwise the year (if provided) is expected to follow the month and date.

If a time-zone is specified in *string*, it is used when encoding the *universal-time* value. Otherwise, if a non-`nil` *time-zone* argument was supplied, it used for the encoding. Otherwise, the current time zone adjusted for daylight saving time is used.

If *time-first* is `true`, the time-of-day is expected before the date; otherwise the time-of-day is expected to follow the date.

The returned *position* is the index within *string* where the parse ended.

**parse-date-and-time**

## Purpose

Parse a time-duration-specification string.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>string</i>	A simple string
<i>start</i>	Starting index into <i>string</i> (default is 0)
<i>end</i>	Ending index into <i>string</i> (default is <code>nil</code> , meaning end of <i>string</i> )
<i>separators</i>	A sequence of characters that are skipped between specification items (default is " , ")

## Returns

The duration, in seconds

## Description

The following time-duration-unit specifiers are recognized (both singular and plural):

"second"	(or "sec" or "s")
"minute"	(or "min" or "m")
"hour"	(or "hr" or "h")
"day"	(or "d")
"week"	(or "wk")
"month"	(or "mon")
"year"	(or "yr")

A "month" is interpreted as exactly 30 days; a "year" as 365 days.

## See also

<b>pretty-duration</b>	(page <a href="#">192</a> )
<b>parse-time</b>	(page <a href="#">190</a> )

## Examples

```
> (parse-duration "2 minutes")
60
> (parse-duration "-2min")
-60
> (parse-duration "2m")
60
> (parse-duration "365 days, 5 hours, 49 minutes, 12 seconds")
```

```
31556952
> (parse-duration "365d 5h 49m 12s")
31556952
> (parse-duration "365d5h49m12s")
31556952
> (parse-duration "1min -2secs")
58
> (parse-duration "1m-2s")
58
> (parse-duration "1/2hr")
1800
> (parse-duration "0.5hr")
1800.0
> (parse-duration "2 months")
5184000
> (parse-duration "3 wks")
1814400
```

---

**parse-time** *string* &key *start end junk-allowed separators* ⇒ *second, minute, hour, time-zone, daylight-savings-p, pos* [Function]

---

## Purpose

Parse a time-of-day specification string.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>string</i>	A simple string
<i>start</i>	Starting index into <i>string</i> (default is 0)
<i>end</i>	Ending index into <i>string</i> (default is <code>nil</code> , meaning end of <i>string</i> )
<i>junk-allowed</i>	A generalized boolean (default is <code>nil</code> )
<i>separators</i>	A sequence of characters that are skipped and separate the hour, minute, and second fields in <i>string</i> , if needed (default is " : ")
<i>second</i>	An integer between 0 and up to 59, inclusive
<i>minute</i>	An integer between 0 and up to 59, inclusive
<i>hour</i>	An integer between 0 and up to 23, inclusive
<i>time-zone</i>	A time zone: a rational multiple of 1/3600 between -24 and 24 that represents the number of hours offset from GMT
<i>daylight-savings-p</i>	A generalized boolean
<i>position</i>	A index in <i>string</i>

## Returns

Six values: *second, minute, hour, time-zone, daylight-savings-p*, and *position*

## Errors

If *junk-allowed* is false, an error is signaled if a numeric field in *string* does not consist entirely of the representation of a integer, possibly surrounded on either side by characters in *separators*.

## Description

If no hour, minute, or second values are specified in *string*, they default to zero. The values returned for *time-zone* and *daylight-savings-p* will be `nil` unless a time-zone is specified in *string*.

The returned *position* is the index within *string* where the parse ended.

---

**pretty-duration** *seconds* &optional *maximum-fields destination* ⇒ *result*

---

[Function]

## Purpose

Format a numeric time duration (in *seconds*) into descriptive text.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*seconds* A number  
*maximum-fields* An integer from 1–5 indicating maximum number of fields to include in the descriptive *string* (default is 5, indicating all fields should be included)  
*destination* Either *nil*, *t*, a stream, or a string with a fill pointer (default is *nil*)  
*result* A string or *nil*

## Returns

If *destination* is non-*nil*, then *nil*; otherwise, a string.

## Description

The value of *seconds* is rounded to the nearest 100<sup>th</sup> of a second before conversion. Fields omitted by *maximum-fields* cause appropriate rounding of the generated description.

## Examples

```
> (pretty-duration 1000)
"16 minutes, 40 seconds"
> (pretty-duration -1000)
"minus 16 minutes, 40 seconds"
> (pretty-duration -1000.12345)
"minus 16 minutes, 40.12 seconds"
> (pretty-duration -1000.12543)
"minus 16 minutes, 40.13 seconds"
> (pretty-duration 166611.9)
"1 day, 22 hours, 16 minutes, 51.91 seconds"
> (pretty-duration 166611.9 4)
"1 day, 22 hours, 16 minutes, 52 seconds"
> (pretty-duration 166611.9 3)
"1 day, 22 hours, 17 minutes"
> (pretty-duration 166611.9 2)
"1 day, 22 hours"
> (pretty-duration 166611.9 1)
"2 days"
```

```
> (pretty-duration 31556952)
"365 days, 5 hours, 49 minutes, 12 seconds"
>
```

---

**pretty-run-time-duration** *internal-time-units* &optional *maximum-fields destination* [*Function*]  
⇒ *result*

---

## Purpose

Format a run-time duration (in *internal-time-units*) into descriptive text.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*internal-time-units* A number

*maximum-fields* An integer from 1–5 indicating maximum number of fields to include in the descriptive *string* (default is 5, indicating all fields should be included)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

The *internal-time-units* run-time duration is rounded to the nearest 100<sup>th</sup> of a second before conversion. Fields omitted by *maximum-fields* cause appropriate rounding of the generated description.

## See also

**brief-duration** (page [165](#))

**brief-run-time-duration** (page [167](#))

**parse-duration** (page [188](#))

**pretty-duration** (page [192](#))

## Examples

```
> internal-time-units-per-second
1000
> (pretty-run-time-duration 1000)
"1 second"
> (pretty-run-time-duration 5)
"0 seconds"
> (pretty-run-time-duration 6)
"0.01 seconds"
> most-positive-fixnum
536870911
> (pretty-run-time-duration most-positive-fixnum)
"6 days, 5 hours, 7 minutes, 50.94 seconds"
>
```

---

**very-brief-date** &optional *universal-time* &key *time-zone month-precedes-date* [Function]  
*year-first include-year separator destination* ⇒ *result*

---

## Purpose

Generate a very brief date description.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*universal-time* A Universal Time (default is `nil`, which is equivalent to the value returned by `(get-universal-time)`)

*time-zone* A time zone (default is `nil`, which is equivalent to the current time zone adjusted for daylight saving time)

*month-precedes-date* A generalized boolean (default is **\*month-precedes-date\***)

*year-first* A generalized boolean (default is **\*year-first\***)

*include-year* A generalized boolean (default is `t`)

*separator* A character (default is `#\ /`)

*destination* Either `nil`, `t`, a stream, or a string with a fill pointer (default is `nil`)

*result* A string or `nil`

## Returns

If *destination* is non-`nil`, then `nil`; otherwise, a string.

## Description

If *universal-time* is not supplied or is `nil`, the current time (as returned by `get-universal-time` is used.

If *time-zone* is not supplied or is `nil`, it defaults to the current time zone adjusted for daylight saving time. If *time-zone* is supplied, it is assumed to include any adjustment for daylight saving time.

If *month-precedes-date* is true, the month is presented in front of the date; otherwise the date precedes the month.

If *year-first* is supplied and is non-`nil`, the year is presented in front of the month and date; otherwise the year follows the month and date.

If *include-year* is supplied and is non-`nil`, the year is included in the presented time.

## See also

**\*month-precedes-date\*** (page [158](#))

**brief-date-and-time** (page [163](#))

**full-date-and-time** (page [172](#))

**internet-text-date-and-time** (page [177](#))

**iso8601-date-and-time** (page [179](#))

**message-log-date-and-time** (page [180](#))

## Examples

Display the current date (with and without the year):

```
> (very-brief-date)
"2/16/2008"
> (very-brief-date (get-universal-time) :include-year nil)
"2/16"
>
```

---

## very-brief-date

### 3.5 Offset Universal Time

Common Lisp has three time representations: Decoded Time, Universal Time, and Internal Time. Universal Time (UT) allows specific points in time from the beginning of 1900 to be represented with one-second resolution (ignoring leap seconds). The disadvantage of absolute Universal Time values is that they are bignums in most Common Lisp implementations.

To reduce computation and storage requirements, a fourth time representation, Offset Universal Time (OT), can be used. Offset Universal Time is Universal Time that is offset by an integer time-base value so that the most often used Offset Universal Time values in an application are fixnums.

Nearly all Common Lisp implementations provide fixnums of at least 30 bits (34 years of time range) or more, but CLISP on 32-bit machines provides only 25 bits (388 days). The ANSI standard requires an implementation to provide fixnums with at least 16 bits (only 18 hours), but fortunately Common Lisp implementations are considerably more generous!

When developing applications that must represent time values that exceed the fixnum range, it is important to choose the best time-base offset value to reduce bignum costs. Of course, existing Offset Universal Time values will appear shifted if the time-base offset value is changed.

---

**\*ot-base\***

[*Variable*]

---

### **Purpose**

Holds the Offset Universal Time time-base value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** An Offset Universal Time time-base value

**Initial value** Must be set by using **set-ot-base**

### **See also**

**check-ot-base** (page [199](#))

**ot2ut** (page [200](#))

**set-ot-base** (page [202](#))

**ut2ot** (page [204](#))

---

---

**check-ot-base** &optional *suppress-warning* ⇒ *boolean*

---

[*Function*]

## Purpose

Check if the current time can be represented as a `fixnum` given the current Offset Universal Time time-base value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*suppress-warning* A generalized boolean (default is `nil`)

*boolean* A generalized boolean

## Returns

True if the current time can be represented as a `fixnum` Offset Universal Time value; `nil` otherwise.

## Errors

The Offset Universal Time time-base value has not been set.

## See also

**\*ot-base\*** (page [198](#))

**ot2ut** (page [200](#))

**set-ot-base** (page [202](#))

**ut2ot** (page [204](#))

## Examples

Set the time base for Offset Universal Time to today and check:

```
> (set-ot-base)
3410655616
> (check-ot-base)
t
>
```

Set the time base for Offset Universal Time to January 1, 1900 and check:

```
> (set-ot-base 1 1 1900)
16777216
> (check-ot-base)
;; Warning: The current time represented as an Offset~Universal~Time is not
a fixnum.
nil
> (check-ot-base 't)
nil
>
```

## Purpose

Convert an Offset Universal Time value to a Universal Time value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*offset-universal-time* An Offset Universal Time value

*universal-time* A Universal Time

## Returns

The equivalent Universal Time value

## Errors

The Offset Universal Time time-base value has not been set.

## See also

**\*ot-base\*** (page [198](#))

**check-ot-base** (page [199](#))

**ut2ot** (page [204](#))

**set-ot-base** (page [202](#))

## Example

```
> (set-ot-base 1 7 2007)
3409014016
> (ot2ut -15071348)
3393942668
>
```

## REPL Note

The equivalent of:

```
(full-date-and-time (ot2ut offset-universal-time)
 :include-seconds 't
 :destination *standard-output*)
```

can be invoked using the REPL command `:ot offset-universal-time`.

---

---

**printvot** *form*\* ⇒ *result*\*

[Macro]

---

## Purpose

Assist debugging involving Offset Universal Time values by printing forms and the results of evaluating them to *\*trace-output\**. Any form producing a single-valued integer result is assumed to be an Offset Universal Time value and a convenient **full-date-and-time** format (including seconds) is printed as the result value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*forms* An implicit `progn` of forms to be evaluated and printed

*results* The values returned by evaluating the last *form* that is not the keyword symbol `:hr`

## Returns

The values returned by evaluating the last *form* that is not the keyword symbol `:hr`

## Description

The following is performed for each form in *forms*:

- if the form is the keyword symbol `:hr`, a dashed separator line printed to *\*trace-output\**
- if the form is a string (before evaluation), it is treated as a label and printed to *\*trace-output\** without enclosing double-quote characters
- if the form is a self-evaluating object, it is printed to *\*trace-output\**
- otherwise, the form is printed to *\*trace-output\**, then the form is evaluated and the result values are printed to *\*trace-output\**. Unlike **printv**, a single-valued integer result is assumed to be an Offset Universal Time value and when that result is printed by **printvot**, it is first converted to Universal Time and then to **full-date-and-time** format (including seconds).

## See also

**full-date-and-time** (page [172](#))

**printv** (page [108](#))

## Examples

```
> (printvot "PRINTVOV example" *ot-base* (ut2ot) :hr)
;; PRINTVOV example
;; *ot-base* => "Oct 22 2117 04:40:32"
;; (ut2ot) => "Jun 4 2008 13:51:08"
;; -----
-15071348
>
```

---

**set-ot-base** &optional *date month year time-zone* ⇒ *ot-base*

---

[Function]

## Purpose

Set the Offset Universal Time time-base value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*date* An integer between 1 and up to 31, inclusive, depending on the month and year or *nil*, indicating the current date (default is *nil*)

*month* An integer between 1 and 12, inclusive or *nil*, indicating the current month (default is *nil*)

*year* An integer indicating the year A.D. or *nil*, indicating the current year (default is *nil*); if the *year* integer is between 0 and 99, the “obvious” year is assumed.

*time-zone* A time zone: a rational multiple of 1/3600 between -24 and 24 that represents the number of hours offset from GMT (default is zero)

## Returns

The Offset Universal Time time-base value

## Description

Without any arguments, **set-ot-base** sets the time-base value to the current date. Setting the time base to the current date can be used in applications that do not need to represent historical dates and that do not save or communicate Offset Universal Time values. However, setting the time base to a specific date is recommended for most applications.

## See also

**\*ot-base\*** (page [198](#))

**check-ot-base** (page [199](#))

**ot2ut** (page [200](#))

**ut2ot** (page [204](#))

## Examples

Set the time base for Offset Universal Time to today:

```
> (set-ot-base)
3436662016
>
```

Note that the returned Offset Universal Time time-base value (above) is not the current Universal Time value:

```
> (get-universal-time)
3419947437
>
```

Set the time base for Offset Universal Time to July 1, 2007:

```
> (set-ot-base 1 7 2007)
3409014016
>
```

---

**set-ot-base**

---

**ut2ot** &optional *universal-time* ⇒ *offset-universal-time*

---

[*Function*]

## Purpose

Convert a Universal Time value to an Offset Universal Time value.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*universal-time* A Universal Time value (default is the current Universal Time)

*offset-universal-time* An Offset Universal Time value

## Returns

The equivalent Offset Universal Time value

## Errors

The Offset Universal Time time-base value has not been set.

## See also

**\*ot-base\*** (page [198](#))

**check-ot-base** (page [199](#))

**ot2ut** (page [200](#))

**set-ot-base** (page [202](#))

## Examples

codeindexitmultiple-value-callcodeindexitencode-universal-time

```
> (set-ot-base 1 7 2007)
3409014016
> (ut2ot)
-15071348
> (ut2ot 3393942668)
-15071348
> (ut2ot (multiple-value-call #'encode-universal-time
    ;; noon on the Fourth of July, 2008:
    0 0 12 (parse-date "July 4, 2008")))
15161984
>
```

## 3.6 Transitioning Sets and Tables

Ideally, native Common Lisp hash tables operations should always be very fast. On some Common Lisp implementations, however, a small amount of time (and space) can be saved by using list-based representations for hash tables with small entry counts. These list-based representations transition automatically to regular hash tables as the entry count grows beyond the performance-advantage threshold (and back to the list representation as the count shrinks). These auto-transitioning representations add a small overhead to normal hash table operations, so their use should be considered very carefully (and restricted to situations where the counts tend to remain low).

### ESETs

An ESET (short for `eq-set`) is a keys-only table that automatically transitions between list and hash-table implementations. The keys are used to represent elements of the ESET and are compared using `eq`.

### ETs

An ET (short for `eq-table`) is a key-and-value table that automatically transitions between list and hash-table implementations. The keys are compared using `eq`.

---

**add-to-eset** *item eset*  $\Rightarrow$  *item*

---

[Function]

### Purpose

Add *item* to *eset* if it is not already present using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*item* An object

*eset* An ESET

### Returns

The *item*

### See also

**in-eset** (page [211](#))

**make-eset** (page [212](#))

**delete-from-eset** (page [207](#))

### Examples

```
> (defparameter *eset* (make-eset))
*eset
> (in-eset 'x *eset*)
nil
nil
```

```
> (add-to-eset 'x *eset*)
x
> (in-eset 'x *eset*)
x
t
> (in-eset nil *eset*)
nil
nil
> (add-to-eset nil *eset*)
nil
> (in-eset nil *eset*)
nil
t
>
```

---

**add-to-eset**

---

**delete-from-eset** *item eset* ⇒ *deleted-p*

---

[*Function*]

## Purpose

Delete *item* from *eset* if it is present using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*eset* An ESET

*deleted-p* A generalized boolean

## Returns

True, if *item* was deleted from *eset*; nil otherwise

## See also

**add-to-eset** (page [205](#))

**in-eset** (page [211](#))

**make-eset** (page [212](#))

## Examples

```
> (defparameter *eset* (make-eset))
*eset
> (add-to-eset 'x *eset*)
x
> (in-eset 'x *eset*)
x
t
> (delete-from-eset 'x *eset*)
t
> (in-eset 'x *eset*)
nil
nil
> (delete-from-eset 'x *eset*)
nil
>
```

---

**delete-et** *item et* ⇒ *deleted-p*

---

[*Function*]

## Purpose

Delete *item* from *et* if it is present using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*et* An ET

*deleted-p* A generalized boolean

## Returns

True, if *item* was deleted from *et*; nil otherwise

## See also

**get-et** (page [209](#))

**make-et** (page [213](#))

## Examples

```
> (defparameter *et* (make-et))
*et*
> (setf (get-et 'x *et*) 3)
3
> (get-et 'x *et*)
3
t
> (delete-et 'x *et*)
t
> (get-et 'x *et*)
nil
nil
> (delete-et 'x *et*)
nil
>
```

---

**get-et** *key et* &optional *default* ⇒ *value, present-p*

---

[Function]

## Purpose

Return the value associated with *key* in *et* using `eq` as the key-comparison function.

## Self syntax

(`setf` (`get-et` *key et* &optional *default*) *value*) ⇒ *value*

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*key* An object

*et* An ET

*value* An object

*present-p* A generalized boolean

## Returns

Two values:

- The value associated with the given *key* or *default* if no entry is associated with *key*
- True, if an entry was found; `nil` if there is no such entry

When `setf` is used with **get-et**, the supplied *value* is returned as a single value.

## Description

`setf` may be used with **get-et** to replace the value associated with the given *key*, or to add a new entry. When a **get-et** form is used as a `setf` place, any *default* which is supplied is evaluated, but its value is ignored.

## See also

**make-et** (page [213](#))

**assq** (page [66](#))

**delete-et** (page [208](#))

## Examples

```
> (defparameter *e* (make-et))
*e*
> (get-et 'x *e*)
nil
nil
> (get-et 'x *e* ':missing)
:missing
nil
> (setf (get-et 'x *e*) 1)
1
> (get-et 'x *e*)
```

```
1
t
> (get-et nil *et*)
nil
nil
> (setf (get-et nil *et*) nil)
nil
> (get-et nil *et*)
nil
t
>
```

---

**get-et**

---

## Purpose

Determine if *item* is in *eset* using `eq` as the comparison function.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*item* An object

*eset* An ESET

*item-or-nil* An object or `nil`

*present-p* A generalized boolean

## Returns

Two values:

- *item*, if *item* is a member of *eset*; otherwise `nil`
- True, if an entry was found; `nil` if there is no such entry

## See also

**add-to-eset** (page [205](#))

**make-eset** (page [212](#))

**memq** (page [102](#))

**delete-from-eset** (page [207](#))

## Examples

```
> (defparameter *eset* (make-eset))
*eset
> (in-eset 'x *eset*)
nil
nil
> (add-to-eset 'x *eset*)
x
> (in-eset 'x *eset*)
x
t
> (in-eset nil *eset*)
nil
nil
> (add-to-eset nil *eset*)
nil
> (in-eset nil *eset*)
nil
t
>
```

---

**make-eset** <no arguments>⇒ *eset*

---

[*Function*]

## Purpose

Create an empty ESET.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*eset* An ESET

## Returns

An empty ESET

## See also

**add-to-eset** (page [205](#))

**in-eset** (page [211](#))

**delete-from-eset** (page [207](#))

## Examples

```
> (make-eset)
(0)
>
```

---

**make-et** <no arguments>⇒ *et*

---

[*Function*]

### **Purpose**

Create an empty ET.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### **Arguments**

*et*      An ET

### **Returns**

An empty ET

### **See also**

### 3.7 Search Trees

A red-black tree is binary search tree that is roughly balanced, keeping the worst-case time values for operations such as inserting, deleting, and searching proportional to the height of the tree.

Left-leaning red-black (LLRB) trees are a simpler version of red-black trees in which all red links must “lean” left except during inserts and deletes. LLRB trees have good worst-case running time for their operations and are efficient in general use.

---

**llrb-tree-count** *llrb-tree* ⇒ *count*

---

[*Function*]

### Purpose

Return number of entries stored in *llrb-tree*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

### Arguments

*llrb-tree* An LLRB tree

*count* A non-negative integer

### Returns

The number of entries stored in *llrb-tree*

### See also

**llrb-tree-delete** (page [216](#))

**llrb-tree-p** (page [217](#))

**llrb-tree-test** (page [218](#))

**llrb-tree-value** (page [219](#))

**make-llrb-tree** (page [221](#))

**map-llrb-tree** (page [222](#))

### Example

```
> (llrb-tree-count *tree*)
3
>
```

---

---

**llrb-tree-delete** *key llrb-tree* ⇒ *deleted-p*

---

[*Function*]

## Purpose

Delete the entry associated with a given key.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*key* An object

*llrb-tree* An LLRB tree

*deleted-p* A generalized boolean

## Returns

True if the entry was deleted; nil if it was not found

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-p** (page [217](#))

**llrb-tree-test** (page [218](#))

**llrb-tree-value** (page [219](#))

**make-llrb-tree** (page [221](#))

**map-llrb-tree** (page [222](#))

## Example

Delete the entry stored under 1 in the LLRB-tree *\*tree\**, then try deleting it a second time:

```
> (llrb-tree-delete 1 *tree*)
t
> (llrb-tree-delete 1 *tree*)
nil
```

---

**llrb-tree-p** *object* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if an object is an LLRB tree.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*object* An object

*boolean* A generalized boolean

## Returns

True if *object* is an LLRB tree; `nil` otherwise.

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-delete** (page [216](#))

**llrb-tree-test** (page [218](#))

**llrb-tree-value** (page [219](#))

**make-llrb-tree** (page [221](#))

**map-llrb-tree** (page [222](#))

## Example

```
> (llrb-tree-p *tree*)  
t  
>
```

---

---

**llrb-tree-test** *llrb-tree* ⇒ *comparison-test*

---

[*Function*]

## Purpose

Return the three-way comparison test function used in *llrb-tree*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*llrb-tree* An LLRB tree

*comparison-test* A function designator specifying the three-way comparison test function object used in *llrb-tree*

## Returns

The comparison test used in *llrb-tree*

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-delete** (page [216](#))

**llrb-tree-p** (page [217](#))

**llrb-tree-value** (page [219](#))

**make-llrb-tree** (page [221](#))

**map-llrb-tree** (page [222](#))

## Example

```
> (llrb-tree-test *tree*)  
compare&  
>
```

---

---

**llrb-tree-value** *key llrb-tree* &optional *default* ⇒ *value, present-p*

---

[Function]

## Purpose

Return the value associated with a given key.

## Self syntax

(setf (llrb-tree-value *key llrb-tree* &optional *default*) *value*) ⇒ *value*  
*value, present-p*

⇒

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*key* An object

*llrb-tree* An LLRB tree

*default* An object (default is nil)

*value* An object

*present-p* A generalized boolean

## Returns

Two values:

- The value associated with the given *key* or *default* if no entry is associated with *key*
- True, if an entry was found; nil if there is no such entry

## Description

Setf may be used with **llrb-tree-value** to replace the value associated with the given *key*, or to add a new entry. When a **llrb-tree-value** form is used as a setf place, any *default* which is supplied is evaluated, but its value is ignored.

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-delete** (page [216](#))

**llrb-tree-p** (page [217](#))

**llrb-tree-test** (page [218](#))

**make-llrb-tree** (page [221](#))

**map-llrb-tree** (page [222](#))

## Example

```
> (defparameter *tree* (make-llrb-tree #'compare&))
*tree*
> (llrb-tree-value 1 *tree*)
nil
> (setf (llrb-tree-value 1 *tree*) 'a)
a
> (llrb-tree-value 1 *tree*)
```

a  
t  
>

---

**llrb-tree-value**

---

**make-llrb-tree** *comparison-test* ⇒ *llrb-tree*

---

[Function]

## Purpose

Create an empty left-leaning red-black tree.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*comparison-test* A three-way comparison test

*llrb-tree* An LLRB tree

## Returns

An empty left-leaning red-black tree

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-delete** (page [216](#))

**llrb-tree-p** (page [217](#))

**llrb-tree-test** (page [218](#))

**llrb-tree-value** (page [219](#))

**map-llrb-tree** (page [222](#))

## Example

```
> (make-llrb-tree #'compare&)
#<compare& llrb-tree with 0 entries>
>
```

---

## Purpose

Apply a function once to the key and value of each entry in an LLRB tree.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

*function*            A function designator specifying a function object of two arguments

*llrb-tree*            An LLRB tree

## See also

**llrb-tree-count** (page [215](#))

**llrb-tree-delete** (page [216](#))

**llrb-tree-p**        (page [217](#))

**llrb-tree-test**    (page [218](#))

**llrb-tree-value** (page [219](#))

**make-llrb-tree** (page [221](#))

## Example

```
> (map-llrb-tree
   #'(lambda (key value)
       (printv key value))
   *tree*)
;; key => 1
;; value => a
;; key => 2
;; value => b
;; key => 3
;; value => c
nil
>
```

## 4 Additional GBBopen Tools

Additional GBBopen Tool entities are grouped into modules that can be loaded as appropriate. Documentation for these additional-tool entities is arranged according to the following modules:

- uniform interfaces to implementation-specific thread (multiprocessing) capabilities are provided by the `:portable-threads` module (see page [224](#))
- polling functions for Common Lisp implementations that do not provide thread capabilities are provided by the `:polling-functions` module (see page [298](#))
- uniform socket interfaces are provided by the `:portable-sockets` module (see page [304](#))
- uniform interfaces to the operating system are provided by the `:os-interface` module (see page [317](#))
- Double Metaphone phonetic-code computation is provided by the `:double-metaphone` module (see page [315](#)) module.

## 4.1 Portable Threads

GBBopen's Portable Threads provides a uniform interface to commonly used thread (multiprocessing) entities. Wherever possible, these entities do something reasonable in Common Lisp implementations that do not provide threads. However, entities that make no sense without threads signal errors in non-threaded implementations (as noted with each entity). The feature `:threads-not-available` is added on Common Lisp implementations without thread support, and the feature `:with-timeout-not-available` is added on implementations that do not support **with-timeout**.

Portable Threads entities are provided by the `:portable-threads` module in GBBopen. Stand-alone use of the Portable Threads interface is also easy, requiring only the `portable-threads.lisp` file for the portable-interface layer and, if desired, `scheduled-periodic-functions.lisp` for the scheduled and periodic function entities (see page 268).

### Threads and Processes

Common Lisp implementations that provide multiprocessing capabilities use one of two approaches:

- *Application-level threads* (also called “Lisp processes”) which are created, deleted, and scheduled internally by the Common Lisp implementation
- *Operating-system threads* (or “native threads”) which are lightweight, operating-system threads that are created, deleted, and scheduled by the operating system

There are advantages and complexities associated with each approach, and the Portable Threads Interface is designed to provide a uniform abstraction over them that can be used to code applications that perform consistently and efficiently on any supported Common Lisp implementation.

### Locks

Common Lisp implementations provide differing semantics for the behavior of mutual-exclusion locks that are acquired recursively by the same thread: some always allow recursive use, others provide special “recursive” lock objects in addition to non-recursive locks, and still others allow recursive use to be specified at the time that a lock is being acquired. To enable behavioral consistency in all Common Lisp implementations, the `:portable-threads` interface module provides (non-recursive) locks and recursive locks and a single acquisition form, **with-lock-held**, that behaves appropriately for each lock type.

### Condition Variables

POSIX-style condition variables provide an atomic means for a thread to release a lock that it holds and go to sleep until it is awakened by another thread. Once awakened, the lock that it was holding is reacquired atomically before the thread is allowed to do anything else.

A condition variable must always be associated with a lock (or recursive lock) in order to avoid a race condition created when one thread signals a condition while another thread is preparing to wait on it. In this situation, the second thread would be perpetually waiting for the signal that has already been sent. In the POSIX model, there is no explicit link between the lock used to control access to the condition variable and the condition variable. The Portable Threads Interface makes this association explicit by bundling the lock with the **condition-variable** CLOS object instance and allowing the **condition-variable** object to be used directly in lock entities.

### Hibernation

---

Sometimes it is desirable to put a thread to sleep (perhaps for a long time) until some event has occurred. The Portable Threads Interface provides two entities that make this situation easy to code: **hibernate-thread** and **awaken-thread**. Thread hibernation can only be performed by the thread on itself, eliminating issues of a thread being hibernated at an undesirable time. Note that there is the potential for a hibernate/awaken race condition if a thread hibernates itself again soon after being awakened (when a second **awaken-thread** intended for the original hibernation is applied to the second hibernation rather than being ignored because the target thread is not hibernating). Using a **condition-variable** is preferable in this situation.

When a thread is hibernating, it remains available to respond to **run-in-thread** and **symbol-value-in-thread** operations as well as to be awakened by a dynamically surrounding **with-timeout**.

### What about Process Wait?

Thread coordination functions, such as `process-wait`, are expensive to implement with operating-system threads. Such functions stop the executing thread until a Common Lisp predicate function returns a true value. With application-level threads, the Lisp-based scheduler evaluates the predicate function periodically when looking for other threads that can be run. With operating-system threads, however, thread scheduling is performed by the operating system and evaluating a Common Lisp predicate function requires complex and expensive interaction between the operating-system thread scheduling and the Common Lisp implementation. Given this cost and complexity, many Common Lisp implementations that use operating-system threads have elected not to provide `process-wait`-style coordination functions, and this issue extends to the Portable Threads Interface as well.

Fortunately, most uses of `process-wait` can be replaced by a different strategy that relies on the producer of a change that would affect the `process-wait` predicate function to signal the event rather than having the consumers of the change use predicate functions to poll for it. Condition variables, the Portable Threads **hibernate-thread** and **awaken-thread** mechanism, or blocking I/O functions cover most of the typical uses of `process-wait`.

### Portable Threads entities

Descriptions of the Portable Threads entities follow.

---

**all-threads** <no arguments> ⇒ *list-of-threads*

---

[*Function*]

## Purpose

Return a list of all known threads.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*list-of-threads* A proper list

## Returns

A list of objects representing the threads.

## Description

The returned list of threads is accurate only at the precise instant the **all-threads** function is called. New threads may be created or existing threads killed at any time, so the returned list is always potentially outdated.

## See also

**current-thread** (page [244](#))

**thread-alive-p** (page [257](#))

**threadp** (page [261](#))

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Example

```
> (all-threads)
(#<thread Listener 1>)
>
```

## Notes

On Common Lisp implementations without threads, `nil` is returned.

The returned list of threads should not be destructively altered.

---

---

**as-atomic-operation** *form*\*  $\Rightarrow$  *primary-value*

---

[*Macro*]

## Purpose

Execute *forms* as an atomic operation.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*primary-value* The first value returned by evaluating the last *form*

## Returns

The primary value returned by evaluating the last *form*.

## Description

This macro provides atomicity in the following entities (when the Common Lisp implementation does not support them directly): **atomic-decf**, **atomic-decf&**, **atomic-delete**, **atomic-flush**, **atomic-incf**, **atomic-incf&**, **atomic-push**, **atomic-pushnew**, and **atomic-pop**. It is intended only for implementing very brief atomic operations and should not be used for long computations or computations that wait or block.

Note that **as-atomic-operation** is only guaranteed to return a single value, not multiple values.

## See also

**atomic-decf** (page [228](#))  
**atomic-decf&** (page [229](#))  
**atomic-delete** (page [230](#))  
**atomic-flush** (page [232](#))  
**atomic-incf** (page [233](#))  
**atomic-incf&** (page [234](#))  
**atomic-push** (page [236](#))  
**atomic-pushnew** (page [237](#))  
**atomic-pop** (page [235](#))

## Example

Define an atomic **nsorted-insert**:

```
(defun atomic-nsorted-insert (&rest args)
  (declare (dynamic-extent args))
  (as-atomic-operation (apply #'nsorted-insert args)))
```

---

**atomic-decf** *place* [*delta-form*] ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Decrement the value stored in *place* as an atomic operation.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference

*delta-form* A form that is evaluated to produce a delta value (default is 1)

*new-place-value* A number

## Returns

The new value of *place*.

## See also

**as-atomic-operation** (page [227](#))

**atomic-decf&** (page [229](#))

**atomic-delete** (page [230](#))

**atomic-flush** (page [232](#))

**atomic-incf** (page [233](#))

**atomic-incf&** (page [234](#))

**atomic-pop** (page [235](#))

**atomic-pushnew** (page [237](#))

## Examples

```
> x
5
> (atomic-decf x)
4
> (atomic-decf x 1.5)
2.5
>
```

---

---

**atomic-decf&** *place* [*delta-form*] ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Decrement the fixnum value stored in *place* as an atomic operation.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference containing a fixnum value

*delta-form* A form that is evaluated to produce a fixnum delta value (default is 1)

*new-place-value* A fixnum

## Returns

The new fixnum value of *place*.

## See also

**as-atomic-operation** (page [227](#))

**atomic-decf** (page [228](#))

**atomic-delete** (page [230](#))

**atomic-flush** (page [232](#))

**atomic-incf** (page [233](#))

**atomic-incf&** (page [234](#))

**atomic-pop** (page [235](#))

**atomic-pushnew** (page [237](#))

## Examples

```
> x
5
> (atomic-decf& x)
4
> (atomic-decf& x 2)
2
>
```

---

---

**atomic-delete** *item place &key from-end test test-not start end count key* ⇒ *sequence* [Macro]

---

## Purpose

As an atomic operation, set *place* to the sequence in *place* from which the elements that satisfy the *test* have been removed.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*item* An object

*place* A form which is suitable for use as a generalized reference that contains a proper sequence

*from-end* A generalized boolean (default is `nil`)

*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is `#'eql`)

*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of `:test-not` is deprecated)

*start* Starting index into *sequence* (default is 0)

*end* Ending index into *sequence* (default is `nil`, meaning end of *sequence*)

*count* An integer or `nil` (default is `nil`)

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

*sequence* A sequence

## Returns

The sequence in *place* from which the elements that satisfy the *test* have been removed.

## Description

Replaces *place* with the sequence in *place* from which elements that satisfy the *test* have been deleted. The supplied *place* sequence may be modified in constructing the result; however, modification of the sequence itself is not guaranteed.

Specifying a *from-end* value of true matters only when the *count* is provided, and in that case only the rightmost *count* elements satisfying the *test* are deleted.

**delq** (page [80](#))

**delq-one** (page [81](#))

### Example

```
> list
(1 2 3)
> (atomic-delete 2 list)
(2 3)
> list
(2 3)
>
```

---

**atomic-delete**

---

**atomic-flush** *place* ⇒ *old-place-value*

---

[*Macro*]

## Purpose

As an atomic operation, set the value of *place* to `nil`, and return the value *place* had prior to being set.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference

*old-place-value* An object

## Returns

The *place* value prior to being set to `nil`.

## See also

**as-atomic-operation** (page [227](#))

**atomic-delete** (page [230](#))

**atomic-pop** (page [235](#))

**atomic-push** (page [236](#))

**atomic-pushnew** (page [237](#))

## Example

```
> list
(1 2 3)
> (atomic-flush list)
(1 2 3)
> list
nil
>
```

---

**atomic-incf** *place* [*delta-form*] ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Increment the value stored in *place* as an atomic operation.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference

*delta-form* A form that is evaluated to produce a delta value (default is 1)

*new-place-value* A number

## Returns

The new value of *place*.

## See also

**atomic-flush** (page [232](#))

**atomic-incf&** (page [234](#))

**atomic-pop** (page [235](#))

**atomic-pushnew** (page [237](#))

## Examples

```
> x
2
> (atomic-incf x)
3
> (atomic-incf x 1.5)
4.5
>
```

---

---

**atomic-incf&** *place* [*delta-form*] ⇒ *new-place-value*

---

[*Macro*]

## Purpose

Increment the fixnum value stored in *place* as an atomic operation.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference containing a fixnum value

*delta-form* A form that is evaluated to produce a fixnum delta value (default is 1)

*new-place-value* A fixnum

## Returns

The new fixnum value of *place*.

## See also

**atomic-flush** (page [232](#))

**atomic-incf** (page [233](#))

**atomic-pop** (page [235](#))

**atomic-pushnew** (page [237](#))

## Examples

```
> x
2
> (atomic-incf& x)
3
> (atomic-incf& x 2)
5
>
```

---

---

## Purpose

As an atomic operation, remove the first element from the list stored in *place*, store the updated list in *place*, and return the removed first element.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*place* A form which is suitable for use as a generalized reference that contains a proper list or a dotted list

*element* An object

## Returns

The first element (the car) of the list stored in *place*.

## See also

**as-atomic-operation** (page [227](#))

**atomic-delete** (page [230](#))

**atomic-flush** (page [232](#))

**atomic-push** (page [236](#))

**atomic-pushnew** (page [237](#))

## Example

```
> list
(1 2 3)
> (atomic-pop list)
1
> list
(2 3)
>
```

---

**atomic-push** *item place* ⇒ *new-place-value*

---

[*Macro*]

## Purpose

As an atomic operation, prepend *item* to the list stored in *place* and store the updated list in *place*.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*item* An object

*place* A form which is suitable for use as a generalized reference

*new-place-value* A proper list

## Returns

The new value of *place*.

## See also

**as-atomic-operation** (page [227](#))

**atomic-delete** (page [230](#))

**atomic-flush** (page [232](#))

**atomic-pop** (page [235](#))

**atomic-pushnew** (page [237](#))

## Example

```
> list
(1 2 3)
> (atomic-push 10 list)
(10 1 2 3)
>
```

---

---

## Purpose

As an atomic operation, when *item* is not the same as any element in the list stored in *place*, prepend *item* to the list and store the updated list in *place*.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*item* An object

*place* A form which is suitable for use as a generalized reference that contains a proper list

*key* A function designator specifying a function object of one argument, or `nil` (default is `nil`)

*test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is `#'eq1`)

*test-not* A function designator specifying a function object of two arguments that returns a generalized boolean (use of `:test-not` is deprecated)

*new-place-value* A proper list

## Returns

The new value of *place*.

## See also

**as-atomic-operation** (page [227](#))

**atomic-delete** (page [230](#))

**atomic-flush** (page [232](#))

**atomic-pop** (page [235](#))

**atomic-push** (page [236](#))

## Examples

```
> list
(1 2 3)
> (atomic-pushnew 2 list)
(1 2 3)
> (atomic-pushnew 10 list)
(10 1 2 3)
>
```

---

**awaken-thread** *thread*

[*Function*]

---

### **Purpose**

Awaken a hibernating thread.

**Package** :portable-threads

**Module** :portable-threads

### **Arguments**

*thread* A thread

### **Errors**

Threads (multiprocessing) is not supported on the Common Lisp implementation.

### **Description**

An attempt to awaken a non-hibernating thread is ignored.

### **See also**

**hibernate-thread** (page [245](#))

### **Example**

```
(awaken-thread thread)
```

---

---

**condition-variable***[Class]*

---

**Package** :portable-threads**Module** :portable-threads**Description**

The class **condition-variable** is a subclass of `standard-object`. Instances of **condition-variable** include an associated lock, which can be either a lock (the default) or a recursive lock.

**See also****make-condition-variable** (page [247](#))**define-class** (page [83](#))

---

## Purpose

Unblock all threads that are blocked on *condition-variable*.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*condition-variable* A condition variable

## Errors

The lock (or recursive lock) associated with *condition-variable* is not held by the executing process.

## Description

If no threads are blocked on *condition-variable*, this function is a no-op.

## See also

<b>condition-variable-signal</b>	(page <a href="#">241</a> )
<b>condition-variable-wait</b>	(page <a href="#">242</a> )
<b>condition-variable-wait-with-timeout</b>	(page <a href="#">243</a> )
<b>make-condition-variable</b>	(page <a href="#">247</a> )
<b>with-lock-held</b>	(page <a href="#">263</a> )
<b>without-lock-held</b>	(page <a href="#">267</a> )

## Example

Acquire the lock associated with *condition-variable* and then signal all blocked threads that are waiting on it:

```
(with-lock-held (condition-variable)
  (condition-variable-broadcast condition-variable))
```

## Note

On Common Lisp implementations without threads, this function does nothing.

---

## Purpose

Unblock one thread that is blocked on *condition-variable*.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*condition-variable* A condition variable

## Errors

The lock (or recursive lock) associated with *condition-variable* is not held by the executing process.

## Description

If no threads are blocked on *condition-variable*, this function is a no-op.

## See also

**condition-variable-broadcast** (page [240](#))

**condition-variable-wait** (page [242](#))

**condition-variable-wait-with-timeout** (page [243](#))

**make-condition-variable** (page [247](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Example

Acquire the lock associated with *condition-variable* and then signal one blocked thread that is waiting on it:

```
(with-lock-held (condition-variable)
  (condition-variable-signal condition-variable))
```

## Note

On Common Lisp implementations without threads, this function does nothing.

---

**Purpose**

Block the current thread on *condition-variable*.

**Package** :portable-threads

**Module** :portable-threads

**Arguments**

*condition-variable* A condition variable

**Errors**

The lock (or recursive lock) associated with *condition-variable* is not held by the executing process.

Threads (multiprocessing) is not supported on the Common Lisp implementation.

**See also**

**condition-variable-broadcast** (page [240](#))

**condition-variable-signal** (page [241](#))

**condition-variable-wait-with-timeout** (page [243](#))

**make-condition-variable** (page [247](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

**Example**

Acquire the condition-variable lock and then wait until signaled by another thread:

```
(with-lock-held (condition-variable)
  (condition-variable-wait condition-variable))
```

---

**condition-variable-wait-with-timeout** *condition-variable* *seconds* ⇒ *boolean*

---

[*Function*]

## Purpose

Block the current thread on *condition-variable* or until *seconds* seconds have elapsed.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*condition-variable* A condition variable

*seconds* A number

*boolean* A generalized boolean

## Returns

True if *condition-variable* is unblocked before *seconds* seconds have elapsed; `nil` if the timeout has occurred.

## Errors

The lock (or recursive lock) associated with *condition-variable* is not held by the executing process.

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**condition-variable-broadcast** (page [240](#))

**condition-variable-signal** (page [241](#))

**condition-variable-wait** (page [242](#))

**make-condition-variable** (page [247](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Example

Acquire the condition-variable lock and then wait until signaled by another thread or until 5 seconds have elapsed:

```
(with-lock-held (condition-variable)
  (condition-variable-wait-with-timeout condition-variable 5))
```

---

**current-thread** <no arguments> ⇒ *thread*

---

[*Function*]

## Purpose

Return the object representing the current thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread

## Returns

The object representing the current thread.

## See also

**all-threads** (page [226](#))

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Example

```
> (current-thread)
#<thread Listener 1>
>
```

## Note

On Common Lisp implementations without threads, the keyword symbol `:threads-not-available` is returned.

---

---

**hibernate-thread** <no arguments>

---

[*Function*]

### **Purpose**

Hibernate the current thread.

**Package** :portable-threads

**Module** :portable-threads

### **Errors**

Threads (multiprocessing) is not supported on the Common Lisp implementation.

### **See also**

**awaken-thread** (page [238](#))

### **Example**

Hibernate the current thread:

```
(hibernate-thread)
```

---

---

**kill-thread** *thread*

[*Function*]

---

### Purpose

Kill a thread.

**Package** :portable-threads

**Module** :portable-threads

### Arguments

*thread* A thread

### Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

### See also

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

**thread-alive-p** (page [257](#))

### Example

```
(kill-thread thread)
```

---

---

**make-condition-variable** &rest *initargs* &key *class lock* ⇒ *condition-variable*

---

[Function]

## Purpose

Create a new condition variable.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*initargs* An initialization argument list  
*class* The name of the class for the created condition-variable instance (default is *condition-variable*)  
*lock* A lock, a recursive lock, or a condition variable (default is a non-recursive lock)  
*condition-variable* A condition variable

## Returns

The created **condition-variable**.

## See also

**make-instance** (page [364](#))  
**make-lock** (page [249](#))  
**make-recursive-lock** (page [250](#))  
**with-lock-held** (page [263](#))  
**without-lock-held** (page [267](#))

## Examples

Make a **condition-variable** instance with a non-recursive lock:

```
> (make-condition-variable)
#<condition-variable>
>
```

Make a **condition-variable** instance with a recursive lock:

```
> (make-condition-variable :lock (make-recursive-lock))
#<condition-variable>
>
```

Define a subclass of **condition-variable** that includes a state slot:

```
(defclass state-cv (condition-variable)
  ((state :initarg :state
          :initform nil
          :accessor state-of)))
```

and then create a *state-cv* instance with a recursive lock:

```
> (make-condition-variable :class 'state-cv
                          :lock (make-recursive-lock))
#<state-cv>
>
```

**Note**

The **make-condition-variable** function is equivalent to using **make-instance** with the desired class for the created condition-variable instance. However, using **make-condition-variable** is preferable stylistically.

---

**make-condition-variable**

---

**make-lock** &key *name* ⇒ *lock*

---

[*Function*]

## Purpose

Create a lock.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*name* A string.

*lock* A lock

## Returns

The newly created lock.

## See also

**make-condition-variable** (page [247](#))

**make-recursive-lock** (page [250](#))

**thread-holds-lock-p** (page [262](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Example

```
> (make-lock :name "Priority Queue")
#<lock Priority Queue>
>
```

## Note

On Common Lisp implementations without threads, a “pseudo-lock” object is returned.

---

---

**make-recursive-lock** &key *name* ⇒ *recursive-lock*

---

[*Function*]

## Purpose

Create a recursive lock.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*name* A string.

*lock* A recursive lock

## Returns

The newly created recursive lock.

## See also

**make-condition-variable** (page [247](#))

**make-lock** (page [249](#))

**thread-holds-lock-p** (page [262](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Example

```
> (make-recursive-lock :name "Priority Queue")
#<recursive-lock Priority Queue>
>
```

## Note

On Common Lisp implementations without threads, a “pseudo-recursive-lock” object is returned.

---

---

**nearly-forever-seconds****[Constant]**

---

**Purpose**

The maximum number of seconds supported by `sleep`.

**Package** :portable-threads**Module** :portable-threads**Value type** A fixnum**Value** Implementation dependent**See also****sleep-nearly-forever** (page [253](#))

---

**run-in-thread** *thread function* &rest *args*

---

[*Function*]

## Purpose

Force *thread* to apply *function* to *args*.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread

*function* A function designator

*args* Arguments to the function

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Example

```
(run-in-thread thread
  #'(lambda (result) (throw ':exit result))
  result)
```

---

---

**sleep-nearly-forever** &optional *seconds*

---

[*Function*]

### Purpose

A maximum-time-bounded sleep.

**Package** :portable-threads

**Module** :portable-threads

### Arguments

*seconds* An integer (default is **nearly-forever-seconds**)

### Description

Calls `sleep` with *seconds* or **nearly-forever-seconds**, whichever is less. Using **nearly-forever-seconds** protects against exceeding the duration limit of the Common Lisp implementation's `sleep` function for very long duration sleeping, by truncating the duration to **nearly-forever-seconds**.

### See also

**nearly-forever-seconds** (page [251](#))

### Examples

```
> (sleep-nearly-forever) ; sleep for a very long time
...
> (sleep-nearly-forever ; sleep as long as the above
  (* 2 nearly-forever-seconds))
...
>
```

---

**spawn-form** *form*\*  $\Rightarrow$  *thread*

[*Macro*]

---

## Purpose

Evaluate *forms* in a new thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*form* A form

*thread* A thread

## Returns

The object representing the new thread.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**all-threads** (page [226](#))

**awaken-thread** (page [238](#))

**current-thread** (page [244](#))

**hibernate-thread** (page [245](#))

**spawn-thread** (page [255](#))

**thread-alive-p** (page [257](#))

**thread-name** (page [258](#))

**thread-whostate** (page [259](#))

**threadp** (page [261](#))

**run-in-thread** (page [252](#))

**symbol-value-in-thread** (page [256](#))

## Example

```
> (spawn-form (sleep 60))
#<thread Form (sleep 60)>
>
```

---

---

**spawn-thread** *name function &rest args* ⇒ *thread*

---

[*Function*]

## Purpose

Spawn a new thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*name* A string

*function* A function designator

*args* Arguments to the function

*thread* A thread

## Returns

The object representing the new thread.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**all-threads** (page [226](#))

**awaken-thread** (page [238](#))

**current-thread** (page [244](#))

**hibernate-thread** (page [245](#))

**kill-thread** (page [246](#))

**spawn-form** (page [254](#))

**thread-alive-p** (page [257](#))

**thread-name** (page [258](#))

**thread-whostate** (page [259](#))

**threadp** (page [261](#))

**run-in-thread** (page [252](#))

**symbol-value-in-thread** (page [256](#))

## Example

```
> (spawn-thread "Sleepy" #'sleep 60)
#<thread Sleepy>
>
```

---

---

**symbol-value-in-thread** *symbol thread* ⇒ *object, boundp*

---

[*Function*]

## Purpose

Return the value of *symbol* in a thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*symbol* A symbol

*thread* A thread

*object* An object

*boundp* A generalized boolean

## Returns

Two values:

- the value of *symbol* in *thread* or nil if no value is bound
- t if *symbol* is specially or globally bound in *thread*; otherwise nil

## Description

The global symbol value is returned as the first value if no thread-local value is bound.

## See also

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Examples

```
> (symbol-value-in-thread '*x* thread)
33
t
> (symbol-value-in-thread 'pi thread)
3.141592653589793d0
t
> (symbol-value-in-thread '*unbound* thread)
nil
nil
>
```

## Note

On Common Lisp implementations without threads, this function obtains the global symbol value.

---

---

**thread-alive-p** *thread* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a thread is alive.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread

*boolean* A generalized boolean

## Returns

True if *thread* is alive; nil otherwise.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**all-threads** (page [226](#))

**kill-thread** (page [246](#))

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Examples

```
> (defparameter *silly-thread* (spawn-thread "Sleeper" 'sleep 10000))
*silly-thread*
> (thread-alive-p *silly-thread*)
t
> (kill-thread *silly-thread*)
t
> (thread-alive-p *silly-thread*)
nil
>
```

---

---

**thread-name** *thread* ⇒ *name-string*

---

[*Function*]

## Purpose

Return the name of a thread.

## Self syntax

(setf (thread-name *thread*) *name-string*) ⇒ *name-string*

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread

*name-string* A string

## Returns

The name of *thread*.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

## Examples

```
> (thread-name thread)
"Initial"
> (setf (thread-name thread) "Version 2")
"Version 2"
> (thread-name thread)
"Version 2"
>
```

## Note

Digitool's [Macintosh Common Lisp](#) does not support changing the thread name via **setf**.

---

---

**thread-whostate** *thread* ⇒ *whostate*

---

[Function]

## Purpose

Return a string that describes the current state of a thread.

## Self syntax

(**setf** (thread-whostate *thread*) *whostate*) ⇒ *whostate*

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread

*whostate* A string or nil

## Returns

The whostate string of the thread or nil.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Example

```
> (thread-whostate thread)
"Running"
>
```

## Note

Although the *whostate* value can provide helpful information when debugging, specific *whostate* values and their meanings vary among Common Lisp implementations and should not be used programmatically.

Only [Allegro CL](#), [Clozure CL](#), and Digitool's [Macintosh Common Lisp](#) support user-settable whostates; (**setf whostate**) is a no-op on other Common Lisp implementations.

---

---

**thread-yield** <no arguments>

---

[*Function*]

### **Purpose**

Give other threads a chance to execute.

**Package** :portable-threads

**Module** :portable-threads

### **Example**

```
(thread-yield)
```

### **Note**

On Common Lisp implementations without thread support, this function executes **run-polling-functions** if the `:polling-functions` module has been loaded. Otherwise, it is a no-op on non-threaded implementations.

---

---

**threadp** *object* ⇒ *boolean*

---

[*Function*]

## Purpose

Check if *object* is an object representing a thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*object* An object

*boolean* A generalized boolean

## Returns

True if *object* is an object representing a thread; `nil` otherwise.

## See also

**all-threads** (page [226](#))

**spawn-form** (page [254](#))

**spawn-thread** (page [255](#))

**thread-alive-p** (page [257](#))

## Example

```
> (threadp (car (all-threads)))  
t  
>
```

---

---

**thread-holds-lock-p** *lock* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if *lock* is held by the current thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*lock* A lock, a recursive lock, or a condition variable

*boolean* A generalized boolean

## Returns

True if the current thread holds *lock*; nil otherwise.

## See also

**make-condition-variable** (page [247](#))

**make-lock** (page [249](#))

**make-recursive-lock** (page [250](#))

**with-lock-held** (page [263](#))

**without-lock-held** (page [267](#))

## Examples

Two simple examples using a lock:

```
> (thread-holds-lock-p lock)
nil
> (with-lock-held (lock)
   (thread-holds-lock-p lock))
t
>
```

Two more simple examples using a condition variable:

```
> (thread-holds-lock-p condition-variable)
nil
> (with-lock-held (condition-variable)
   (thread-holds-lock-p condition-variable))
t
>
```

---

**with-lock-held** (*lock* &key *whostate*) *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

After acquiring a lock or a recursive lock, execute forms and then release the lock.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*lock* A lock, a recursive lock, or a condition variable  
*whostate* A string (default "With Lock Held")  
*forms* An implicit **progn** of forms to be evaluated  
*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Errors

A thread attempts to re-acquire a (non-recursive) lock that it holds.

## Description

If a thread executes a **with-lock-held** that is dynamically inside another **with-lock-held** involving the same recursive lock, the inner **with-lock-held** simply proceeds as if it had acquired the lock.

## See also

**make-condition-variable** (page [247](#))  
**make-lock** (page [249](#))  
**make-recursive-lock** (page [250](#))  
**thread-holds-lock-p** (page [262](#))  
**thread-whostate** (page [259](#))  
**without-lock-held** (page [267](#))

## Examples

Acquire the lock controlling access to a critical section of code:

```
(with-lock-held (lock :whostate "Waiting for Critical Lock")  
  (critical-section))
```

A silly example showing a recursive re-acquisition of a recursive lock:

```
(with-lock-held (recursive-lock :whostate "Waiting for Critical Lock")  
  (with-lock-held (recursive-lock :whostate "Again Waiting for Critical  
Lock")  
    (critical-section)))
```

Acquire the lock associated with `condition-variable` and then signal all blocked threads that are waiting on it:

```
(with-lock-held (condition-variable)  
  (condition-variable-signal condition-variable))
```

## Note

The *whostate* value is ignored by [SBCL](#).

---

**with-lock-held**

---

**with-timeout** (*seconds* *timeout-form*\*) *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Bound the time allowed to evaluate *forms* to *seconds*, evaluating *timeout-forms* if the time limit is reached.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*seconds* A number

*timeout-forms* An implicit **progn** of forms to be evaluated if the timed *forms* do not complete before *seconds* seconds have elapsed

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form* or the last *timeout-form*

## Returns

The values returned by evaluating the last *form* if completed in less than *seconds* seconds; otherwise the values returned by evaluating the last *timeout-form*

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation. However, **with-timeout** is also supported on non-threaded [SBCL](#).

## Description

If the evaluation of *forms* does not complete within *seconds* seconds, execution of *forms* is terminated and the *timeout-forms* are evaluated, returning the result of the last *timeout-form*. The *timeout-forms* are not evaluated if the *forms* complete within *seconds* seconds, in which case the result of the last *form* is returned.

## See also

**condition-variable-wait-with-timeout** (page [243](#))

## Examples

Evaluate a simple form, with a one-second time out:

```
> (with-timeout (1 ' :timed-out)
  ' :did-not-time-out)
:did-not-time-out
>
```

Again, but this time sleep for two seconds to cause a time out:

```
> (with-timeout (1 ' :timed-out)
  (sleep 2)
  ' :did-not-time-out)
:timed-out ; (after 1 second)
>
```

Uses of **with-timeout** can be nested:

```
> (with-timeout (1 ' :timed-out-outer)
  (with-timeout (2 ' :timed-out-inner)
    (sleep 3)
    ' :did-not-time-out))
:timed-out-outer      ; (after 1 second)
> (with-timeout (2 ' :timed-out-outer)
  (with-timeout (1 ' :timed-out-inner)
    (sleep 3)
    ' :did-not-time-out))
:timed-out-inner      ; (after 1 second)
>
```

---

## with-timeout

---

**without-lock-held** (*lock* &key *whostate*) *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Temporarily release a lock or a recursive lock, execute forms and then reacquire the lock.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*lock* A lock, a recursive lock, or a condition variable  
*whostate* A string (default "Without Lock Held")  
*forms* An implicit **progn** of forms to be evaluated  
*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Errors

A thread attempts to release a lock that it does not hold.

## See also

**make-condition-variable** (page [247](#))

**make-lock** (page [249](#))

**make-recursive-lock** (page [250](#))

**thread-holds-lock-p** (page [262](#))

**thread-whostate** (page [259](#))

**with-lock-held** (page [263](#))

## Example

Acquire and temporarily release a lock controlling access to several critical sections of code:

```
(with-lock-held (lock :whostate "Waiting for Critical Lock")
  (critical-section-1)
  (without-lock-held (lock :whostate "Doing non-critical stuff")
    (non-critical-section))
  (critical-section-2))
```

## Note

The *whostate* value is ignored by [SBCL](#).

---

## 4.2 Scheduled and Periodic Functions

GBBopen provides two forms of time-scheduled functions: scheduled functions and periodic functions, both built using Portable Threads (see page 224). These time-scheduled-function entities are provided by the `:portable-threads` module.

### Scheduled Functions

A scheduled function is an object that contains a function to be run at a specified time. When that specified time arrives, the function is invoked with a single argument: the scheduled function object. A repeat interval (in seconds) can also be specified for the scheduled function. This value is used whenever the scheduled function is invoked to schedule itself again at a new time relative to the current invocation. Scheduled functions can be scheduled to a resolution of one second.

Scheduled functions are scheduled and invoked by a separate "Scheduled-Function Scheduler" thread. Unless the run time of the invoked function is brief, the invoked function should spawn a new thread in which to perform its activities so as to avoid delaying the invocation of a subsequent scheduled function.

### Periodic Functions

A periodic function is a function to be run repeatedly at a specified interval. Unlike scheduled functions, which can be scheduled only to a resolution of one second, a periodic function can be repeated at intervals as brief as is supported by the `sleep` function of the Common Lisp implementation. A periodic function is scheduled and executed in its own thread. As with scheduled functions, the invoked function should spawn a new thread in which to perform its activities, unless its run time is brief.

### Portable Threads entities

Descriptions of the Portable Threads entities follow.

---

**\*periodic-function-verbose\****[Variable]*

---

## Purpose

Controls whether initiation and termination of periodic-function threads are printed as comments.

**Package** :portable-threads

**Module** :portable-threads

**Value type** A generalized boolean

**Initial value** nil

## Description

The value of **\*periodic-function-verbose\*** can be changed globally to display the management of periodic functions.

## See also

**kill-periodic-function** (page [272](#))

**spawn-periodic-function** (page [294](#))

## Example

Schedule a simple periodic function with verbose printing enabled:

```
> (setf *periodic-function-verbose* 't)
t
> (spawn-periodic-function #'(lambda () (print "Hello!")) 0.1
   :name 'hello
   :count 2)
;; Spawning periodic-function thread for hello...
#<thread Periodic Function hello>
>
"Hello!"
"Hello!"
;; Exiting periodic-function thread hello
>
```

---

---

**\*schedule-function-verbose\***

[Variable]

---

## Purpose

Controls whether scheduling changes made to scheduled functions are printed as comments.

**Package** :portable-threads

**Module** :portable-threads

**Value type** A generalized boolean

**Initial value** nil

## Description

The value of **\*schedule-function-verbose\*** can be changed globally to display the activities of the scheduled function scheduler.

## See also

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

**unschedule-function** (page [296](#))

## Example

Change the invocation time of scheduled function `quitting-time` from 5pm to 5:30pm with verbose printing enabled:

```
> (setf *schedule-function-verbose* 't)
t
> (schedule-function 'quitting-time (encode-time-of-day 0 30 17)
  :repeat-interval #>(* 24 60 60))
;; Unscheduling #<scheduled-function quitting-time [17:00:00]>...
;; Scheduling #<scheduled-function quitting-time [17:30:00]>
;; as the next scheduled-function...
>
```

---

**all-scheduled-functions** <no arguments> ⇒ *list-of-scheduled-functions*

---

[*Function*]

## Purpose

Return the list of all scheduled functions that are currently scheduled.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*list-of-scheduled-functions* A proper list

## Returns

A list of `scheduled-function` objects.

## See also

**make-scheduled-function** (page [273](#))

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

**unschedule-function** (page [296](#))

## Example

```
> (all-threads)
(#<thread Listener 1>)
>
```

## Notes

On Common Lisp implementations without threads, `nil` is returned.

The returned list of scheduled functions should not be destructively altered. In particular, uncanceling a scheduled function (using **unschedule-function**) or changing a scheduled function's invocation time (using **schedule-function**) may modify the list of scheduled functions, so a copy of the returned list of scheduled functions should be used for any iteration that involves these operations.

---

---

**kill-periodic-function** <no arguments>

[*Function*]

---

## Purpose

Terminate the thread invoking a periodic function.

**Package** :portable-threads

**Module** :portable-threads

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

**kill-periodic-function** called outside the dynamic scope of a periodic function.

## See also

**\*periodic-function-verbose\*** (page [269](#))

**all-threads** (page [226](#))

**kill-thread** (page [246](#))

**spawn-periodic-function** (page [294](#))

## Example

Define and spawn a periodic function that is invoked every 0.5 seconds to signal a half-second-interrupt-event, continuing as long as the control shell is running:

```
> (define-event-class half-second-timer-event (timer-interrupt-event)
  ())
half-second-timer-event
> (defun half-second-timer ()
  (unless (control-shell-running-p)
    (kill-periodic-function))
  (signal-event 'half-second-timer-event))
half-second-timer
> (spawn-periodic-function 'half-second-timer 0.5)
#<thread Periodic Function half-second-timer>
>
```

---

---

**make-scheduled-function** *function* &key *name name-test marker marker-test context* [*Function*]  
⇒ *scheduled-function*

---

## Purpose

Create a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*function* A function designator specifying a function object of one argument  
*name* An object (typically a string or a symbol; default is *function*, if *function* is a symbol, otherwise *nil*)  
*name-test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)  
*marker* An object (default is *nil*)  
*marker-test* A function designator specifying a function object of two arguments that returns a generalized boolean (default is #'eql)  
*context* An object (default is *nil*)  
*scheduled-function* A scheduled function

## Returns

The newly created scheduled function.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

Unless the run time to perform the scheduled function is brief, it should spawn a new thread in which to perform its activities so as to avoid delaying the invocation of a subsequent scheduled function.

The optional *marker* and associated comparison *marker-test* can be specified to distinguish scheduled functions with the same *name* in calls to **schedule-function**, **schedule-function-relative**, and **unschedule-function**.

The optional *context* object can be specified to store an invocation context in the *scheduled-function* object that is passed to the scheduled *function* when it is invoked.

## See also

<b>*schedule-function-verbose*</b>	(page <a href="#">270</a> )
<b>all-scheduled-functions</b>	(page <a href="#">271</a> )

<b>restart-scheduled-function-scheduler</b>	(page <a href="#">276</a> )
<b>resume-scheduled-function-scheduler</b>	(page <a href="#">277</a> )
<b>schedule-function</b>	(page <a href="#">278</a> )
<b>schedule-function-relative</b>	(page <a href="#">281</a> )
<b>scheduled-function-context</b>	(page <a href="#">284</a> )

<b>scheduled-function-invocation-time</b>	(page 285)
<b>scheduled-function-marker</b>	(page 286)
<b>scheduled-function-marker-test</b>	(page 287)
<b>scheduled-function-name</b>	(page 288)
<b>scheduled-function-name-test</b>	(page 289)
<b>scheduled-function-repeat-interval</b>	(page 290)
<b>scheduled-function-scheduler-paused-p</b>	(page 292)
<b>scheduled-function-scheduler-running-p</b>	(page 293)
<b>spawn-periodic-function</b>	(page 294)
<b>unschedule-function</b>	(page 296)

## Examples

Create a scheduled function that simply prints "Hello" when invoked:

```
> (make-scheduled-function
   #'(lambda (scheduled-function)
       (declare (ignore scheduled-function))
       (print "Hello"))
   :name 'hello)
#<scheduled-function hello [unscheduled]>
>
```

Create a scheduled function that individualizes the "Hello" when invoked:

```
> (make-scheduled-function
   #'(lambda (scheduled-function)
       (format t "~&Hello ~a~%"
              (scheduled-function-context scheduled-function)))
   :name 'hello
   :context "Bob")
#<scheduled-function hello [unscheduled]>
>
```

A more complex scheduled function that spawns a new thread to do its work and randomly sets whether to reschedule itself (and at what interval):

```
> (defun complex-function (scheduled-function)
   (let ((interval (random 100)))
     (setf (scheduled-function-repeat-interval scheduled-function)
           (if (plusp interval)
               ;; repeat 1-99 seconds from now:
               interval
               ;; don't repeat 1% of the time:
               nil)))
     (spawn-thread "Lots of stuff doer" #'do-lots-of-stuff))
   complex-function)
> (make-scheduled-function 'complex-function)
#<scheduled-function complex-function [unscheduled]>
>
```

---

## make-scheduled-function

---

**pause-scheduled-function-scheduler** <no arguments>

---

[*Function*]

## Purpose

Pause scheduled-function scheduling.

**Package** :portable-threads

**Module** :portable-threads

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

Pausing the scheduled-function scheduler causes all scheduled functions whose invocation time arrives to be held pending until the scheduled-function scheduler is resumed.

## See also

**resume-scheduled-function-scheduler** (page [277](#))

**scheduled-function-scheduler-paused-p** (page [292](#))

**scheduled-function-scheduler-running-p** (page [293](#))

## Example

Pause the scheduled-function scheduler:

```
> (scheduled-function-scheduler-paused-p)
nil
> (pause-scheduled-function-scheduler)
> (scheduled-function-scheduler-paused-p)
t
>
```

---

**restart-scheduled-function-scheduler** <no arguments> ⇒ *thread*

---

[*Function*]

## Purpose

Restart the scheduled-function scheduling thread.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*thread* A thread or `nil`

## Returns

The object representing the newly spawned scheduled-function scheduler thread or `nil` if the scheduled-function scheduler was already running.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

If the scheduled-function scheduler thread has been killed accidentally, this function can be used to start a new scheduler thread.

## See also

**resume-scheduled-function-scheduler** (page [277](#))  
**schedule-function** (page [278](#))  
**scheduled-function-repeat-interval** (page [290](#))  
**scheduled-function-scheduler-paused-p** (page [292](#))  
**scheduled-function-scheduler-running-p** (page [293](#))  
**unschedule-function** (page [296](#))

## Examples

Restart the scheduled-function scheduler:

```
> (restart-scheduled-function-scheduler)
#<thread Scheduled-Function Scheduler>
>
```

Restarting a scheduled-function scheduler that is already running has no effect:

```
> (restart-scheduled-function-scheduler)
;; The scheduled-function scheduler is already running.
nil
>
```

---

**resume-scheduled-function-scheduler** <no arguments>

---

[*Function*]

## Purpose

Resume scheduled-function scheduling.

**Package** :portable-threads

**Module** :portable-threads

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

Resuming the scheduled-function scheduler causes all scheduled functions that have been held pending while the scheduled-function scheduler was paused to be invoked as if their invocation time had just occurred.

## See also

**pause-scheduled-function-scheduler** (page [275](#))

**scheduled-function-scheduler-paused-p** (page [292](#))

**scheduled-function-scheduler-running-p** (page [293](#))

## Example

Resume the scheduled-function scheduler:

```
> (scheduled-function-scheduler-paused-p)
t
> (resume-scheduled-function-scheduler)
> (scheduled-function-scheduler-paused-p)
nil
>
```

---

---

**schedule-function** *name-or-scheduled-function invocation-time*  
&key *marker context repeat-interval verbose*

---

[Function]

## Purpose

Schedule a scheduled function at an absolute invocation time.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

<i>name-or-scheduled-function</i>	An object (typically a string or a symbol) naming a currently scheduled scheduled function or a <code>scheduled-function</code> object
<i>invocation-time</i>	A Universal Time
<i>marker</i>	An object (default is <code>nil</code> )
<i>context</i>	An object (default is <code>nil</code> )
<i>repeat-interval</i>	A positive integer (representing seconds) or <code>nil</code> (default is <code>nil</code> )
<i>verbose</i>	A generalized boolean (default is <b>*schedule-function-verbose*</b> )

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

If the scheduled function is unscheduled, the `scheduled-function` object must be specified as the *name-or-scheduled-function* value. In this case, the scheduled function is added to the list of currently scheduled scheduled functions with the specified *invocation-time* and optional *repeat-interval*, if specified.

If the *scheduled-function* object is currently scheduled, either the `scheduled-function` object or the optional *name* value that was specified when the `scheduled-function` object was created with **make-scheduled-function** can be specified as the *name-or-scheduled-function* value. If a name is specified as the *name-or-scheduled-function* value and more than one scheduled function with the specified *name* is currently scheduled, the scheduled function with the earliest invocation time is selected. If an optional *marker* value was specified along with *name* when the `scheduled-function` object was created with **make-scheduled-function**, the *marker* value can also be specified to restrict the selected scheduled function to the one with the earliest invocation time that matches both the *name* and *marker* values. The selected scheduled function is first unscheduled and then rescheduled with the specified *invocation-time* and optional *repeat-interval*, if specified.

The optional *context* object can be specified to replace the invocation context in the *scheduled-function* object.

## Examples

Schedule a scheduled function that simply prints "Happy New Year!" at midnight (local time) on January 1, 2014:

```
> (schedule-function
  (make-scheduled-function
    #'(lambda (scheduled-function)
        (declare (ignore scheduled-function))
        (print "Happy New Year!"))
    (encode-universal-time 0 0 0 1 1 2014))
  > (all-scheduled-functions)
(#<scheduled-function nil [Jan 1, 2014 00:00:00]>)
>
```

Schedule a scheduled function that prints "It's quitting time!" every day at 5pm:

```
> (schedule-function
  (make-scheduled-function
    #'(lambda (scheduled-function)
        (declare (ignore scheduled-function))
        (print "It's quitting time!"))
    :name 'quitting-time)
  (encode-time-of-day 0 0 17)
  :repeat-interval #.(* 24 60 60))
>
```

Verbosely change quitting-time to 5:30pm every day:

```
> (schedule-function 'quitting-time (encode-time-of-day 0 30 17)
  :repeat-interval #.(* 24 60 60)
  :verbose 't)
;; Unscheduling #<scheduled-function quitting-time [17:00:00]>...
;; Scheduling #<scheduled-function quitting-time [17:30:00]>
;; as the next scheduled-function...
>
```

Schedule a scheduled function that prints an individualized "Hello" message to Bob every day at 9am:

```
> (schedule-function
  (make-scheduled-function
    #'(lambda (scheduled-function)
        (format t "~&Hello ~a~%"
          (scheduled-function-context scheduled-function)))
    :name 'hello
    :context "Bob")
  (encode-time-of-day 0 0 9)
  :repeat-interval #.(* 24 60 60))
>
```

Verbosely change the scheduled function to prints the individualized "Hello" message to Lisa every day at 8:30am (Bob will no longer be greeted):

```
> (schedule-function 'hello (encode-time-of-day 0 30 8)
  :repeat-interval #.(* 24 60 60)
  :context "Lisa"
  :verbose 't)
;; Unscheduling #<scheduled-function hello [09:00:00]>...
;; Scheduling #<scheduled-function hello [08:30:00]>
;; as the next scheduled-function...
>
```

---

**schedule-function**

---

**schedule-function-relative** *name-or-scheduled-function seconds*  
&key *context marker repeat-interval verbose*

---

[Function]

## Purpose

Schedule a scheduled function a specified number of seconds from now.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*name-or-scheduled-function* An object (typically a string or a symbol) naming a currently scheduled scheduled function or a `scheduled-function` object

*seconds* A positive integer

*context* An object (default is `nil`)

*marker* An object (default is `nil`)

*repeat-interval* A positive integer (representing seconds) or `nil` (default is `nil`)

*verbose* A generalized boolean (default is **\*schedule-function-verbose\***)

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

If the scheduled function is unscheduled, the `scheduled-function` object must be specified as the *name-or-scheduled-function* value. In this case, the scheduled function is added to the list of currently scheduled scheduled functions with an invocation time of *interval* seconds from the current time and optional *repeat-interval*, if specified.

If the *scheduled-function* object is currently scheduled, either the `scheduled-function` object or the optional *name* value that was specified when the `scheduled-function` object was created with **make-scheduled-function** can be specified as the *name-or-scheduled-function* value. If a name is specified as the *name-or-scheduled-function* value and more than one scheduled function with the specified *name* is currently scheduled, the scheduled function with the earliest invocation time is selected. If an optional *marker* value was specified along with *name* when the `scheduled-function` object was created with **make-scheduled-function**, the *marker* value can also be specified to restrict the selected scheduled function to the one with the earliest invocation time that matches both the *name* and *marker* values. The selected scheduled function is first unscheduled and then rescheduled with an invocation time of *interval* seconds from the current time and optional *repeat-interval*, if specified.

The optional *context* object can be specified to replace the invocation context in the *scheduled-function* object.

<b>schedule-function-scheduler-running-p</b>	(page <a href="#">293</a> )
<b>spawn-periodic-function</b>	(page <a href="#">294</a> )
<b>unschedule-function</b>	(page <a href="#">296</a> )

## Examples

Schedule a scheduled function that simply prints "Hello!" 5 seconds from now:

```
> (schedule-function-relative
   (make-scheduled-function
    #'(lambda (scheduled-function)
        (declare (ignore scheduled-function))
        (print "Hello!")))
   5)
>
```

Schedule a scheduled function that signals a GBBopen timer-interrupt-event every 30 seconds:

```
> (schedule-function-relative
   (make-scheduled-function
    #'(lambda (scheduled-function)
        (declare (ignore scheduled-function))
        (signal-event 'timer-interrupt-event)))
   30
   :repeat-interval 30)
>
```

Schedule a scheduled function that prints an individualized "Hello" message to Bob five seconds from now, repeating annoyingly every hour thereafter:

```
> (schedule-function-relative
   (make-scheduled-function
    #'(lambda (scheduled-function)
        (format t "~&Hello ~a~%"
                (scheduled-function-context scheduled-function)))
    :name 'hello
    :context "Bob")
   5
   :repeat-interval 3600)
>
```

Verbosely change Bob's annoying repeating "Hello" message to greet Lisa only once, 10 seconds from now:

```
> (schedule-function-relative 'hello 10
   :context "Lisa"
   :verbose 't)
;; Unscheduling #<scheduled-function hello [09:46:11]>...
;; Scheduling #<scheduled-function hello [09:46:27]>...
>
```

### Note

The form `(schedule-function-relative scheduled-function 10)` is equivalent to `(schedule-function scheduled-function (+ (get-universal-time) 10))`.

---

**schedule-function-relative**

---

## Purpose

Return the context object of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*context* An object

## Returns

The context object of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))

**scheduled-function-name** (page [288](#))  
**scheduled-function-name-test** (page [289](#))  
**scheduled-function-repeat-interval** (page [290](#))

## Example

Return the context object of scheduled function `scheduled-function`:

```
> (scheduled-function-context scheduled-function)
"Bob"
>
```

---

**scheduled-function-invocation-time** *scheduled-function* ⇒ *invocation-time*

---

[*Function*]

## Purpose

Return the invocation time of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*invocation-time* A Universal Time

## Returns

The invocation time of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))

**make-scheduled-function** (page [273](#))

**scheduled-function-name** (page [288](#))

**scheduled-function-name-test** (page [289](#))

**scheduled-function-repeat-interval** (page [290](#))

## Example

Return the invocation-time of scheduled function `scheduled-function`:

```
> (scheduled-function-invocation-time scheduled-function)
3465679813
>
```

---

## Purpose

Return the marker of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*marker* An object

## Returns

The marker of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))

**make-scheduled-function** (page [273](#))

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

**scheduled-function-context** (page [284](#))

**scheduled-function-invocation-time** (page [285](#))

**scheduled-function-marker-test** (page [287](#))

**scheduled-function-name** (page [288](#))

**scheduled-function-name-test** (page [289](#))

**scheduled-function-repeat-interval** (page [290](#))

## Example

Return a list of the markers of all currently scheduled scheduled functions:

```
> (mapcar #'scheduled-function-marker (all-scheduled-functions))
(nil)
>
```

---

**scheduled-function-marker-test** *scheduled-function* ⇒ *marker-predicate*

---

[*Function*]

## Purpose

Return the marker-comparison predicate of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*marker-predicate* A function designator specifying a function object of two arguments that returns a generalized boolean

## Returns

The marker-comparison predicate of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))  
**make-scheduled-function** (page [273](#))  
**schedule-function** (page [278](#))  
**schedule-function-relative** (page [281](#))  
**scheduled-function-context** (page [284](#))  
**scheduled-function-invocation-time** (page [285](#))  
**scheduled-function-marker** (page [286](#))  
**scheduled-function-name** (page [288](#))  
**scheduled-function-name-test** (page [289](#))  
**scheduled-function-repeat-interval** (page [290](#))

## Example

Return a list of the marker-comparison predicates of all currently scheduled scheduled functions:

```
> (mapcar #'scheduled-function-marker-test (all-scheduled-functions))  
  (#' eql)  
>
```

---

---

**scheduled-function-name** *scheduled-function* ⇒ *name*

---

[*Function*]

## Purpose

Return the name of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*name* An object (typically a string or a symbol)

## Returns

The name of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))

**make-scheduled-function** (page [273](#))

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

**scheduled-function-context** (page [284](#))

**scheduled-function-invocation-time** (page [285](#))

**scheduled-function-marker** (page [286](#))

**scheduled-function-marker-test** (page [287](#))

**scheduled-function-name-test** (page [289](#))

**scheduled-function-repeat-interval** (page [290](#))

## Example

Return the names of all currently scheduled scheduled functions:

```
> (mapcar #'scheduled-function-name (all-scheduled-functions))
(quitting-time)
>
```

---

---

**scheduled-function-name-test** *scheduled-function*  $\Rightarrow$  *name-predicate*

---

[*Function*]

## Purpose

Return the name-comparison predicate of a scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*name-predicate* A function designator specifying a function object of two arguments that returns a generalized boolean

## Returns

The name-comparison predicate of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))

**make-scheduled-function** (page [273](#))

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

**scheduled-function-context** (page [284](#))

**scheduled-function-invocation-time** (page [285](#))

**scheduled-function-marker** (page [286](#))

**scheduled-function-name** (page [288](#))

**scheduled-function-name-test** (page [289](#))

**scheduled-function-repeat-interval** (page [290](#))

## Example

Return a list of the name-comparison predicates of all currently scheduled scheduled functions:

```
> (mapcar #'scheduled-function-name-test (all-scheduled-functions))
(#'eql)
>
```

## Purpose

Return the repeat interval of a scheduled function.

## Self syntax

(setf (scheduled-function-repeat-interval *scheduled-function*) *repeat-interval*) ⇒ *repeat-interval*

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*scheduled-function* A scheduled function

*repeat-interval* A positive integer (representing seconds) or nil

## Returns

The repeat interval of *scheduled-function*.

## See also

**all-scheduled-functions** (page [271](#))  
**make-scheduled-function** (page [273](#))  
**schedule-function** (page [278](#))  
**schedule-function-relative** (page [281](#))  
**scheduled-function-context** (page [284](#))  
**scheduled-function-invocation-time** (page [285](#))  
**scheduled-function-marker** (page [286](#))  
**scheduled-function-marker-test** (page [287](#))  
**scheduled-function-name** (page [288](#))  
**scheduled-function-name-test** (page [289](#))  
**scheduled-function-repeat-interval** (page [290](#))

## Examples

Display the `scheduled-function` object and its repeat interval for each currently scheduled scheduled function:

```
> (dolist (scheduled-function (all-scheduled-functions))
  (format t "~&; ~s ~s~%"
          scheduled-function
          (scheduled-function-repeat-interval scheduled-function)))
;; #<scheduled-function quitting-time [17:00:00]> 86400
nil
>
```

Define a function to be used as a scheduled function that randomly sets whether to reschedule itself (and at what interval):

```
(defun complex-function (scheduled-function)
  (let ((interval (random 100)))
    (setf (scheduled-function-repeat-interval scheduled-function)
          (if (plusp interval)
              ;; repeat 1-99 seconds from now:
              interval
              ;; don't repeat 1% of the time:
              nil)))
    (do-some-stuff)))
```

---

**scheduled-function-repeat-interval**

---

**scheduled-function-scheduler-paused-p** <no arguments> ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if scheduled-function scheduling is paused.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*boolean* A generalized boolean

## Returns

True if the scheduled-function scheduler is paused; *nil* otherwise.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**pause-scheduled-function-scheduler** (page [275](#))

**resume-scheduled-function-scheduler** (page [277](#))

**scheduled-function-scheduler-running-p** (page [293](#))

## Example

Pause the scheduled-function scheduler:

```
> (scheduled-function-scheduler-paused-p)
nil
> (pause-scheduled-function-scheduler)
> (scheduled-function-scheduler-paused-p)
t
>
```

---

**scheduled-function-scheduler-running-p** <no arguments> ⇒ *boolean*

---

[*Function*]

### Purpose

Determine if the scheduled-function scheduler is running.

**Package** :portable-threads

**Module** :portable-threads

### Arguments

*boolean* A generalized boolean

### Returns

True if the scheduled-function scheduler is running; `nil` otherwise.

### Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

### See also

**pause-scheduled-function-scheduler** (page [275](#))

**restart-scheduled-function-scheduler** (page [276](#))

**resume-scheduled-function-scheduler** (page [277](#))

**scheduled-function-scheduler-paused-p** (page [292](#))

### Example

Check that the scheduled-function scheduler is running:

```
> (scheduled-function-scheduler-running-p)
t
>
```

---

**spawn-periodic-function** *function repeat-interval* &key *count name verbose* ⇒ *thread* [*Function*]

---

## Purpose

Spawn a thread invoking *function* every *repeat-interval* seconds.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*function* A function designator specifying a function object of no arguments  
*repeat-interval* A number (representing seconds)  
*count* A number or `nil` (default is `nil`)  
*name* An object (typically a string or a symbol; default is *function*, if *function* is a symbol, otherwise `nil`)  
*verbose* A generalized boolean (default is **\*periodic-function-verbose\***)  
*thread* A thread

## Returns

The object representing the thread associated with the periodic function.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

If *count* is `nil`, *function* will continue to be invoked every *repeat-interval* seconds until the periodic-function thread is killed or until *function* calls **kill-periodic-function**. Otherwise, *count* is decremented by one prior to each invocation of *function* and, if it is negative, the periodic function is terminated.

## See also

**\*periodic-function-verbose\*** (page [269](#))  
**all-threads** (page [226](#))  
**kill-periodic-function** (page [272](#))  
**kill-thread** (page [246](#))  
**make-scheduled-function** (page [273](#))  
**schedule-function** (page [278](#))  
**schedule-function-relative** (page [281](#))

## Examples

Spawn a simple periodic function that is invoked every 0.1 seconds, but that only runs twice:

```
> (spawn-periodic-function #'(lambda () (print "Hello!")) 0.1
   :name 'hello
   :count 2)
#<thread Periodic Function hello>
>
```

```
"Hello!"  
"Hello!"
```

Spawn a simple periodic function that is invoked every 0.1 seconds that runs up to 20 times, but with a 10% chance on each invocation of terminating early:

```
> (spawn-periodic-function  
  #'(lambda ()  
      (when (zerop (random 10))  
            (kill-periodic-function))  
            (print "Hello!"))  
  0.1  
  :count 20  
  :verbose 't)  
;; Spawning periodic-function thread for...  
#<thread Periodic Function>  
>  
"Hello!"  
"Hello!"  
"Hello!"  
"Hello!"  
;; Killing periodic-function...  
;; Exiting periodic-function thread
```

Define and spawn a periodic function that is invoked every 0.5 seconds to signal a half-second-interrupt-event, continuing as long as the control shell is running:

```
> (define-event-class half-second-timer-event (timer-interrupt-event)  
  ())  
half-second-timer-event  
> (defun half-second-timer ()  
  (unless (control-shell-running-p)  
    (kill-periodic-function))  
  (signal-event 'half-second-timer-event))  
half-second-timer  
> (spawn-periodic-function 'half-second-timer 0.5)  
#<thread Periodic Function half-second-timer>  
>
```

---

**unschedule-function** *name-or-scheduled-function* &key *marker warnp verbose* [Function]  
⇒ *boolean*

---

## Purpose

Cancel the upcoming invocation (and subsequent repeat-interval scheduling) of a currently scheduled scheduled function.

**Package** :portable-threads

**Module** :portable-threads

## Arguments

*name-or-scheduled-function* An object (typically a string or a symbol) naming a currently scheduled scheduled function or a `scheduled-function` object

*marker* An object (default is `nil`)

*verbose* A generalized boolean (default is `*schedule-function-verbose*`)

*warnp* A generalized boolean (default is `t`)

*boolean* A generalized boolean

## Returns

The scheduled function if it was unscheduled; `nil` if the scheduled function was not currently scheduled or was not found.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

If the *scheduled-function* object is currently scheduled, either the `scheduled-function` object or the optional *name* value that was specified when the `scheduled-function` object was created with **make-scheduled-function** can be specified as the *name-or-scheduled-function* value. If a name is specified as the *name-or-scheduled-function* value and more than one scheduled function with the specified *name* is currently scheduled, the scheduled function with the earliest invocation time is selected. If an optional *marker* value was specified along with *name* when the `scheduled-function` object was created with **make-scheduled-function**, the *marker* value can also be specified to restrict the selected scheduled function to the one with the earliest invocation time that matches both the *name* and *marker* values. The selected scheduled function is removed from the list of currently scheduled scheduled functions.

If *warnp* is true, a warning is issued if the scheduled function was not currently scheduled or was not found.

## See also

**\*schedule-function-verbose\*** (page [270](#))

**all-scheduled-functions** (page [271](#))

**make-scheduled-function** (page [273](#))

**schedule-function** (page [278](#))

**schedule-function-relative** (page [281](#))

## Examples

Unschedule the quitting-time scheduled function:

```
> (unschedule-function 'quitting-time)
#<scheduled-function quitting-time [unscheduled]>
>
```

Unschedule all currently scheduled scheduled functions:

```
> (all-scheduled-functions)
(#<scheduled-function nil [Jan 1, 2014 00:00:00]>)
> (mapc #'unschedule-function (all-scheduled-functions))
(#<scheduled-function nil [unscheduled]>)
> (all-scheduled-functions)
nil
>
```

Unschedule a non-existent scheduled function:

```
> (unschedule-function 'non-existent)
;; Warning: Scheduled-function non-existent was not scheduled; no action
taken.
nil
>
```

---

**unschedule-function**

### 4.3 Polling Functions

The `:polling-functions` module provides a set of *polling functions* that can be used to support “event-loop” processing on Common Lisp implementations that do not provide threads. These functions are available for use with all Common Lisp implementations.

---

**add-polling-function** *function* &key *priority*

---

[Function]

### Purpose

Add a polling function to the list of polling functions at the position indicated by *priority*.

**Package** :gbbopen-tools

**Module** :polling-functions

### Arguments

*function* A function designator specifying a function object of no arguments

*priority* A fixnum (default is 0)

### Description

The description is printed to the **\*standard-output\*** stream.

### See also

**describe-all-polling-functions** (page [300](#))

**remove-all-polling-functions** (page [302](#))

**remove-polling-function** (page [301](#))

**run-polling-functions** (page [303](#))

### Example

Add the function `check-for-new-connection` to the list of polling functions (with priority -10):

```
(add-polling-function #'check-for-new-connection
  :priority -10)
```

---

**describe-all-polling-functions** <no arguments>

---

[*Function*]

### **Purpose**

Describe the polling functions in the list of polling functions.

**Package** :gbbopen-tools

**Module** :polling-functions

### **Description**

The description is printed to the **\*standard-output\*** stream.

### **See also**

**add-polling-function** (page [299](#))

**remove-all-polling-functions** (page [302](#))

**remove-polling-function** (page [301](#))

**run-polling-functions** (page [303](#))

### **Example**

Describe list of polling functions:

```
> (describe-all-polling-functions)
;; Polling functions:
;;   -10 #<Function check-for-new-connection>
>
```

**Purpose**

Remove a polling function from the list of polling functions.

**Package** :gbbopen-tools

**Module** :polling-functions

**Arguments**

*function* A function designator

**See also**

**add-polling-function** (page [299](#))

**describe-all-polling-functions** (page [300](#))

**remove-all-polling-functions** (page [302](#))

**run-polling-functions** (page [303](#))

**Example**

Remove the function `check-for-new-connection` from the list of polling functions:

```
(remove-polling-function #'check-for-new-connection)
```

---

---

**remove-all-polling-functions** <no arguments>

---

[*Function*]

### Purpose

Remove all polling functions from the list of polling functions.

**Package** :gbbopen-tools

**Module** :polling-functions

### See also

**add-polling-function** (page [299](#))

**describe-all-polling-functions** (page [300](#))

**remove-polling-function** (page [301](#))

**run-polling-functions** (page [303](#))

### Example

Remove all functions from the list of polling functions:

```
(remove-all-polling-functions)
```

---

---

**run-polling-functions** <no arguments>

---

[Function]

## Purpose

Run every polling function in the list of polling functions.

**Package** :gbbopen-tools

**Module** :polling-functions

## See also

**add-polling-function** (page [299](#))

**describe-all-polling-functions** (page [300](#))

**remove-all-polling-functions** (page [302](#))

**remove-polling-function** (page [301](#))

**start-control-shell** (page [622](#))

## Example

Run the polling functions (once, in sequence):

```
(run-polling-functions)
```

## Note

When a non-nil `:run-polling-functions` value is supplied to **start-control-shell** (the default on Common Lisp implementations without threads), **run-polling-functions** is called at the beginning of every control-shell-cycle and at one-half-second intervals when the Agenda Shell is hibernating due to quiescence.

---

## 4.4 Portable Sockets

The `:portable-sockets` module provides a uniform interface to commonly used socket entities.

---

**accept-connection** *passive-socket* &key *wait* ⇒ *socket-stream*

---

[*Function*]

## Purpose

Accept a socket-stream connection.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*passive-socket* A passive socket

*wait* A generalized boolean (default is `t`)

*socket-stream* A socket stream

## Returns

A socket stream.

## See also

**shutdown-socket-stream** (page [311](#))

**start-connection-server** (page [312](#))

## Example

Accept a connection made to a newly created passive socket:

```
> (let* ((passive-socket (make-passive-socket 5555))
        (connection (accept-connection passive-socket)))
    (close-passive-socket passive-socket)
    connection)
#<socket stream connected from localhost/5555 to localhost/59946>
>
```

## Note

Connections should always be closed using **close** (from both sides) to free up operating-system resources when they are no longer needed.

---

---

**close-passive-socket** *passive-socket*

---

[*Function*]

### **Purpose**

Close a passive socket.

**Package** :portable-sockets

**Module** :portable-sockets

### **Arguments**

*passive-socket* A passive socket

### **See also**

**make-passive-socket** (page [308](#))

### **Example**

Close a passive socket:

```
(close-passive-socket passive-socket)
```

---

---

**local-hostname-and-port** *socket-stream* &optional *do-not-resolve* ⇒ *hostname, port* [*Function*]

---

## Purpose

Return the name of the host on the local side of the *socket-stream* connection and its port number.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*socket-stream* A socket stream

*do-not-resolve* A generalized boolean (default is nil)

*hostname* A string

*port* An integer

## Returns

Two values:

- a string containing the name of the local host
- the integer port number at the local host

## See also

**open-connection** (page [309](#))

**remote-hostname-and-port** (page [310](#))

**with-open-connection** (page [314](#))

## Examples

Return the local hostname and port of an open socket-stream connection to the `wiki.alu.org` web server:

```
> (local-hostname-and-port connection)
"192.168.240.104 (ruby.gbbopen.org) "
56833
>
```

Return the local hostname and port of the open socket-stream connection, but without hostname resolution:

```
> (local-hostname-and-port connection 't)
"192.168.240.104"
56833
>
```

---

**make-passive-socket** *port* &key *backlog interface reuse-address* ⇒ *passive-socket* [Function]

---

## Purpose

Create a passive socket that can accept connections.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*port* An integer or a string specifying the service port  
*backlog* An integer (default is 5)  
*interface* A 32-bit internet address or a string specifying a network interface on the local machine or `nil`  
*reuse-address* A generalized boolean (default is `nil`)  
*passive-socket* A passive socket

## Returns

The new passive socket.

## Description

An *interface* string can be either a host name, such as "localhost" or a "dotted" IP address, such as "127.0.0.1".

The value of *backlog* tells the operating system how many unprocessed connections can be held pending (connected but still awaiting an **accept-connection**).

## See also

**accept-connection** (page [305](#))

**start-connection-server** (page [312](#))

## Example

Create a passive socket, listening on port 5555:

```
> (make-passive-socket 5555)
#<passive socket waiting for connection at */5555>
>
```

## Note

The passive socket should be closed using **close-passive-socket** when the service is no longer needed in order to free up operating system resources.

---

---

**open-connection** *host port* ⇒ *socket-stream*

---

[*Generic Function*]

## Purpose

Open a socket-stream connection to server *host*.

## Method signatures

`open-connection (host integer) port ⇒ socket-stream`

`open-connection (host string) port ⇒ socket-stream`

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*host* A 32-bit internet address or a string specifying the remote host

*port* An integer or a string specifying the service port

*socket-stream* A socket stream

## Returns

A socket stream.

## Description

A *host* string can be either a host name or a “dotted” IP address, such as "127.0.0.1".

String values available for specifying *port* are found in the operating system’s services file and labeled as being `tcp` services. On Unix systems, the services file is `/etc/services`. On Windows, it is the file `services` in the Windows directory.

## See also

**shutdown-socket-stream** (page [311](#))

**with-open-connection** (page [314](#))

## Example

Open a socket connection to the GBBopen Project web server:

```
> (open-connection "GBBopen.org" 80)
#<socket stream connected from localhost/51756 to gbbopen.org/80>
>
```

## Note

Connections should always be closed using **close** (from both sides) when they are no longer needed to free up operating-system resources.

---

---

**remote-hostname-and-port** *socket-stream* &optional *do-not-resolve* [Function]  
⇒ *hostname, port*

---

## Purpose

Return the name of the host on the remote side of the *socket-stream* connection and its port number.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*socket-stream* A socket stream

*do-not-resolve* A generalized boolean (default is nil)

*hostname* A string

*port* An integer

## Returns

Two values:

- a string containing the name of the remote host
- the integer port number at the remote host

## See also

**open-connection** (page [309](#))

**local-hostname-and-port** (page [307](#))

**with-open-connection** (page [314](#))

## Examples

Return the remote hostname and port of an open socket-stream connection to the `wiki.alu.org` web server:

```
> (remote-hostname-and-port connection)
"206.169.106.4 (bibop.alu.org) "
80
>
```

Return the remote hostname and port of the open socket-stream connection, but without hostname resolution:

```
> (remote-hostname-and-port connection 't)
"206.169.106.4"
80
>
```

---

**shutdown-socket-stream** *socket-stream direction*

---

[*Function*]

## Purpose

Shut down (close) one direction of an open connection.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*socket-stream* A socket stream

*direction* The keyword symbol `:input` or `:output` specifying the direction to be closed

## See also

**start-connection-server** (page [312](#))

**open-connection** (page [309](#))

**with-open-connection** (page [314](#))

## Example

Tell the other end of a socket connection that we are done sending output on the socket stream (send an end-of-file indication):

```
(shutdown-socket-stream socket-stream ' :output)
```

## Note

Connections should always be closed using **close** (from both sides) when they are no longer needed to free up operating-system resources.

---

---

**start-connection-server** *function port &key backlog interface name reuse-address* [Function]  
⇒ *thread*

---

## Purpose

Create a connection-server thread that accepts connections and processes them according to *function*.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*function* A function designator specifying a function object of one argument  
*port* An integer or a string specifying the service port  
*backlog* An integer (default is 5)  
*interface* A 32-bit internet address or a string specifying a network interface on the local machine or nil  
*name* A string (default is "Connection Server")  
*reuse-address* A generalized boolean (default is nil)  
*thread* A thread

## Returns

The new connection-server thread.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## Description

The connection server will not accept another connection until *function* returns, so normally *function* should spawn another thread to handle the connection.

An *interface* string can be either a host name, such as "localhost" or a "dotted" IP address, such as "127.0.0.1".

The value of *backlog* tells the operating system how many unprocessed connections can be held pending (connected but still awaiting an **accept-connection**).

## See also

**kill-thread** (page [246](#))

**open-connection** (page [309](#))

**with-open-connection** (page [314](#))

## Example

Start a simple connection server that accepts connections on port 5555, reads one line of input, and closes the connection:

```
> (start-connection-server
   #'(lambda (connection)
       (let ((line (read-line connection nil)))
         (format t "~&; New Connection: ~a~%" line)))
```

```
        (close connection))
    5555)
#<thread Connection Server>
```

### Note

Use **kill-thread** to kill the connection-server thread.

---

start-connection-server

---

**with-open-connection** (*var host port*) *declaration*\* *form*\*

[*Macro*]

---

## Purpose

Open a socket-stream connection to server *host*, perform a series of operations on the connection, and then close the connection.

**Package** :portable-sockets

**Module** :portable-sockets

## Arguments

*var* A variable symbol

*host* A 32-bit internet address or a string specifying the remote host

*port* An integer or a string specifying the service port

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

## Description

This macro ensures that the opened connection is closed when control leaves the body of the macro.

A *host* string can be either a host name or a “dotted” IP address, such as "127.0.0.1".

String values available for specifying *port* are found in the operating system’s services file and labeled as being `tcp` services. On Unix systems, the services file is `/etc/services`. On Windows, it is the file `services` in the `Windows` directory.

## See also

**open-connection** (page [309](#))

**shutdown-socket-stream** (page [311](#))

## Example

Open a socket connection to the GBBopen Project web server:

```
> (with-open-connection (connection "GBBopen.org" 80)
  (flet ((write-crlf (stream)
          ;; HTTP requires CR/LF line termination:
          (write-char #\return stream)
          (write-char #\linefeed stream)))
    (format connection "GET / HTTP/1.1")
    (write-crlf connection)
    (format connection "Host: ~a:~a" host port)
    (write-crlf connection)
    (write-crlf connection)
    (force-output connection)
    (let ((line (read-line connection)))
      (format t "~&; Received: ~a~%" line))))
;; Received: HTTP/1.1 200 OK
>
```

## 4.5 Double Metaphone

The `:double-metaphone` module provides Double Metaphone phonetic-code generation.

The Metaphone algorithm, published by Lawrence Philips in 1990, improved early phonetic approaches, such as Soundex, by attempting to correctly code cases where “gh” is pronounced as “f” as in “laugh” and when it is silent, as in “dough,” or where “t,” “c,” and “s” are pronounced as “sh” (or “ch,” which is treated as a sound that is similar enough to “sh” to be mapped to the same encoding value) as in “ratio,” “ciao,” and “erosion.” Although Metaphone was an improvement, it failed to encode many common words accurately, including the silent “l” in “lincoln,” and the case of “school” where “ch” is pronounced as “k.” Also, by using the Soundex style of encoding an initial vowel as it appears, Metaphone results in different encodings for “Otto” and “auto,” which sound similar enough to match.

Double Metaphone was published by Lawrence Philips in 2000 to improve accuracy further than was achieved by Metaphone. It maps all initial vowels to “A,” matching “Otto” to “auto.” It attempts to correctly encode a number of common words and names commonly found in the United States that are of non-english origin and are usually pronounced correctly according to their non-english spellings, by Americans, such as “Jose” or “pizza.” It also attempts to account for cases where more than one pronunciation may be common in the United States, such as the Spanish name “Cabrillo” which might be plausibly pronounced as “cabreeyo” or “cabrillo.” Double Metaphone addresses exceptions in regular English pronunciation, such as the many cases of silent consonants, such as the silent “l” in “lincoln” or the silent “s” in “island,” as well as the pronunciation of “s” as “sh” in “sugar,” or an anomaly like “caesar,” an unusual case of a “c” followed by an “a” where the “c” is pronounced as “s.”

Even with this more detailed treatment, Double Metaphone still misses a number of common exceptions, such as the silent “p” in “receipt,” many cases where “ch” is pronounced as “k” instead of “ch” as in “monarch,” many cases where Americans pronounce words of non-English origin according to their non-English pronunciations, such as “chutzpah,” and exceptions such as “colonel,” pronounced “kernal,” and “tucson,” pronounced “tooson.”

In addition to providing strict adherence to the Double Metaphone algorithm, this Common Lisp implementation also supports an extended-encoding option that activates additional encoding rules that separate the sounds used for “B” and “P,” for “D” and “T,” for “F” and “V,” and for “S” and “Z.” The extended-encoding option often produces phonetic-code results that are more natural and intuitive.

---

**double-metaphone** *string* &optional *extended-p* ⇒ *primary-index* [, *secondary-index*] [*Function*]

---

## Purpose

Compute the primary and secondary Double Metaphone phonetic-code strings of *string*.

**Package** :gbbopen-tools

**Module** :double-metaphone

## Arguments

*string* A string

*extended-p* A generalized boolean (default is nil)

*primary-index* A string

*secondary-index* A string

## Returns

One or two values: the primary and secondary phonetic-code strings. If there is no secondary code for *string*, only the primary string is returned.

## Description

If *extended-p* is nil, strict Double Metaphone encoding is used. If *extended-p* is true, additional encoding rules that separate sounds are used for “B” and “P,” for “D” and “T,” for “F” and “V,” and for “S” and “Z.”

## Examples

```
> (double-metaphone "testing")
"TSTN"
> (double-metaphone "Smith")
"SM0"
"XMT"
> (double-metaphone "Schmidt")
"XMT"
"SMT"
> (double-metaphone "batboy")
"PTP"
> (double-metaphone "batboy" 't)
"BTB"
> (double-metaphone "Barlow")
"PRL"
"PRLF"
> (double-metaphone "Barlow" 't)
"BRL"
"BRLF"
> (double-metaphone "buzz")
"PS"
> (double-metaphone "buzz" 't)
"BZ"
>
```

## 4.6 OS Interface

The `:os-interface` module provides a uniform interface to commonly used operating-system entities.

---

**browse-hyperdoc** *symbol* ⇒ *boolean*

---

[*Function*]

## Purpose

Display the GBBopen Hyperdoc page for *symbol* in a browser window.

**Package** :gbbopen-tools

**Module** :os-interface

## Arguments

*symbol* A symbol

*boolean* A generalized boolean

## Returns

True if the Hyperdoc file associated with *symbol* is available and has been passed to the preferred browser; no value otherwise.

## Description

The desired browser can be specified in `*preferred-browser*` (see the discussion in GBBopen hyperdoc (see page [7](#)) for details).

## See also

`*preferred-browser*` (page [11](#))

## Example

```
> (browse-hyperdoc 'standard-event-instance)
t
>
```

---

---

**close-external-program-stream** *stream*

[*Function*]

---

### Purpose

Close a stream created by [run-external-program](#).

**Package** :gbbopen-tools

**Module** :os-interface

### Arguments

*stream* The stream to be closed

### See also

[run-external-program](#) (page [321](#))

### Example

```
> (let ((stream (run-external-program "date" nil)))
    (print (read-line stream))
    (close-external-program-stream stream))
"Mon Jul  4 14:06:04 EDT 2005"
>
```

---

---

**kill-external-program** *os-process* &optional *signal-number*

---

[*Function*]

## Purpose

Terminate or signal an external program.

**Package** :gbbopen-tools

**Module** :os-interface

## Arguments

*os-process* An implementation-dependent process representation or `nil`

*signal-number* A small integer (default is 15, the software termination signal)

## Errors

This function is not supported on Windows platforms.

## See also

**run-external-program** (page [321](#))

## Example

```
> (multiple-value-bind (stream os-process)
    (run-external-program "sleep" '("120")))
    (sleep 10)
    (kill-external-program os-process))
t
>
```

---

**run-external-program** *program args &key input output wait*  
⇒ *bidirectional-stream, os-process*

---

[Function]

## Purpose

Run an external program.

**Package** :gbbopen-tools

**Module** :os-interface

## Arguments

<i>program</i>	A string specifying the name of the program to be run
<i>args</i>	A list of strings passed to <i>program</i> as arguments
<i>input</i>	A stream specification (default is <code>:stream</code> , see below)
<i>output</i>	A stream specification (default is <code>:stream</code> , see below)
<i>wait</i>	A generalized boolean (default is <code>nil</code> )
<i>bidirectional-stream</i>	A stream or <code>nil</code>
<i>os-process</i>	An implementation-dependent process representation or <code>nil</code>

## Returns

Two values:

- an input, output, or bi-directional stream or `nil`
- an operating-system process representation, if available, or `nil`

## Errors

Use of a true value for *wait* and a `:stream` value for *input* or *output* is problematic or an error in most Common Lisp implementations.

## Description

The values of *input* and *output* can be:

- `:stream` (the default) which creates a stream that is returned as the first result value; if both *input* and *output* are specified as `:stream`, a bi-directional stream is created and returned
- a string specifying a file to be used as input or output

[LispWorks](#) (non-Windows platforms) and [SBCL](#) do not use a search path for locating *program*, the full path must be specified in the *program* string.

## See also

[close-external-program-stream](#) (page [319](#))

## Example

```
> (let ((stream (run-external-program "date" nil)))
    (print (read-line stream))
    (close-external-program-stream stream))
"Mon Jul  4 14:06:04 EDT 2005"
>
```

## Purpose

Obtain the [Subversion](#) compact version number of a working copy.

**Package** :gbbopen-tools

**Module** :os-interface

## Arguments

*directory* One of the following:

- A string specifying a directory
- A pathname specifying a directory
- A keyword naming a root directory

(default is the GBBopen install directory)

*program* A string specifying the name of the program to be run (default is "svnversion")

*version-string-or-nil* A string or nil

## Returns

A string containing the compact version number or nil if the `program` `svnversion` cannot be found or the specified directory is not in a Subversion working copy.

## Description

[LispWorks](#) (non-Windows platforms) and [SBCL](#) do not use a search path for locating *program*, the full path must be specified in the *program* string.

## Examples

```
> (svn-version)
"525"
> (svn-version :program "/usr/bin/svnversion")
"525"
> (svn-version :directory ' :my-app-root)
"73:76M"
>
```

## 5 GBBopen Core

The GBBopen Core module, `:gbbopen-core`, provides support for the blackboard repository, unit and space classes and instances, inter-instance links, and event signaling.

Documentation for unit-class and unit-instance entities, as well as general-purpose `:gbbopen-core` entities, is included in this section. Documentation for the remaining `:gbbopen-core` entities is arranged into the following sections:

- link entities (Section [5.1](#))
- event, event function, event printing, and event signaling entities (Section [5.2](#))
- interval manipulation entities (Section [5.3](#))
- space-instance and blackboard-repository entities (Section [5.4](#))
- instance retrieval and iteration/mapping entities (Section [5.5](#))
- saving/sending and loading/reading entities (Section [5.6](#))
- queue-management entities (Section [5.7](#))

---

**Purpose**

Controls whether the class of a unit instance is changed to a **deleted-unit-instance** when it is deleted.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A generalized boolean

**Initial value** nil

**Description**

When **\*skip-deleted-unit-instance-class-change\*** is nil, the class of a unit instance is changed to a **deleted-unit-instance** when it is deleted. This helps identify a deleted unit instance that is used inadvertently, at the minor additional cost of the class change when the instance is deleted. In situations where unit instances are created and deleted at a high rate, the class change can be skipped by binding **\*skip-deleted-unit-instance-class-change\*** to a non-nil value. The predicate **instance-deleted-p** can be used to detect either form of a deleted unit instance.

**See also**

**check-for-deleted-instance** (page [327](#))

**delete-instance** (page [334](#))

**deleted-instance-class** (page [336](#))

**deleted-unit-instance** (page [337](#))

**instance-deleted-p** (page [353](#))

**Example**

Create and delete a `hyp` unit instance, first with the default changing-class behavior of **delete-instance** and then with the class-change skipped:

```
> (delete-instance (make-instance 'hyp))
#<deleted-unit-instance hyp 1>
> (instance-deleted-p *)
t
> (let ((*skip-deleted-unit-instance-class-change* 't))
      (delete-instance (make-instance 'hyp)))
#<hyp [Deleted] 2>
> (instance-deleted-p *)
t
>
```

---

**change-class** *instance new-class* &key &allow-other-keys  
⇒ *changed-instance*

---

[*Generic Function*]

## Purpose

Change the class of an instance to *new-class*.

## Method signatures

**change-class** :around (*instance* standard-object) (*new-class* standard-unit-class) &key  
&allow-other-keys ⇒ *instance*

**change-class** :around (*instance* standard-object) (*new-class* standard-unit-class) &key  
&allow-other-keys ⇒ *instance*

**change-class** :before (*instance* standard-unit-instance) (*new-class* standard-class) &key  
&allow-other-keys

**change-class** :after (*instance* standard-unit-instance) (*new-class* standard-unit-class)  
&key &allow-other-keys

**change-class** :after (*instance* standard-object) (*new-class* standard-unit-class) &key  
&allow-other-keys

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*instance* A standard-object instance

*new-class* A class designator

*changed-instance* A standard-object instance

## Returns

The destructively modified *instance*.

## Events

If *instance* is a unit instance, a `change-instance-class-event` is signaled at the start of the class-change process. If *new-class* is a unit class, an `instance-changed-class-event` is signaled when the class change has been completed.

The following events may also be signaled:

- `unlink-event`
- `instance-removed-from-space-instance-event`
- `link-event`
- `nonlink-slot-updated-event`
- `instance-added-to-space-instance-event`

## Errors

The existing or supplied instance name of *instance* is identical to the instance name of an existing unit instance of *new-class*.

## Description

When *new-class* is a unit class, an instance-name conflict with an existing unit instance of *new-class* must be avoided. If the old class of *instance* and *new-class* are both unit classes that use the global instance-name counter, the old instance-name value can be retained safely. If *new-class* is a unit class with a class-based counter, specifying a new instance-name value (using **next-class-instance-number**) is recommended.

When the old class and *new-class* are both unit classes and no space-instances value is supplied to **change-class**, the changed *instance* remains on all space instances that allow *new-class* unit instances. In addition, *instance* is also added to all space instances defined as initial-space-instances for *new-class*. If a space-instances value is supplied, *instance* is removed from all space instances and then added to the supplied space instances.

## See also

**define-unit-class** (page [330](#))

**make-duplicate-instance-changing-class** (page [361](#))

**next-class-instance-number** (page [366](#))

## Example

Change the class of unit instance *hyp* from *probable-hyp* to *rejected-hyp*:

```
> (change-class hyp 'rejected-hyp
   :instance-name (next-class-instance-number 'rejected-hyp))
#<rejected-hyp 1409 (896 388) .68>
>
```

Note that the `:instance-name` initarg can be eliminated if both the old and new classes for *hyp* are using the global instance-name counter.

---

## change-class

**Purpose**

Signal an error if the supplied unit instance has been deleted.

**Package** :gbbopen

**Module** :gbbopen-core

**Arguments**

*unit-instance* A unit instance

*operation* A symbol (default is nil)

**See also**

**delete-instance** (page [334](#))

**instance-deleted-p** (page [353](#))

**Examples**

Create, then delete, then check, a hyp unit instance:

```
> (check-for-deleted-instance (delete-instance (make-instance 'hyp)))
Error: Instance #<deleted-unit-instance hyp 7> has been deleted
>> :abort
> (check-for-deleted-instance (delete-instance (make-instance 'hyp))
                               'my-operation)
Error: my-operation attempted with a deleted instance:
#<deleted-unit-instance hyp 8>
>>
```

---

## Purpose

Signal an error if the locators on any space-instance are inconsistent with the dimension values of the supplied unit instance.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-instance* A unit instance

## Description

Changes to slot values that affect a unit instance's dimension values must be indicated to GBBopen using the **with-changing-dimension-values** macro. Otherwise, locators for the unit instance will not be updated to reflect the new dimension values, resulting in the inability to retrieve the instance where it should be located on a space instance and removed or deleted instances incorrectly retained on a space instance due to the inconsistent locators. **Check-instance-locators** can be used as a debugging aid during development to check for inconsistent locators.

## See also

**with-changing-dimension-values** (page [372](#))

## Examples

Check the locators of all unit instances that are stored on any space instance:

```
> (map-instances-on-space-instances #'check-instance-locators t t)
nil
>
```

Intentionally create inconsistent locators for a hyp unit instance by changing its location without using **with-changing-dimension-values**. Then check its locators:

```
> (defparameter *hyp* (find-instance-by-name 419 'hyp))
*hyp*
> *hyp*
#<hyp 419 (1835 4791) 0.85 [5..35]>
>(check-instance-locators *hyp*)
nil
> (setf (location-of *hyp*) '(2000 2000))
(2000 2000)
> (check-instance-locators *hyp*)
Error: Instance #<hyp 419 (2000 2000) 0.85 [5..35]> is missing (bucket
[21,21])
in #<2d-Uniform-Buckets (bb hyps) (hyp+) (x y) 8>
>>
```

## Purpose

Obtain the current count of unit instances of a unit class.

## Method signatures

`class-instances-count` (*unit-class-name* symbol) ⇒ *count*

`class-instances-count` (*unit-class-specifier* cons) ⇒ *count*

`class-instances-count` (*unit-class* standard-unit-class) ⇒ *count*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-class-or-name* A unit class or a symbol naming a unit class

*count* An integer

## Returns

The count of unit instances of the specified unit class. If an extended unit-classes specification is supplied, the sum of the unit instance counts of the specified classes is returned.

## See also

**next-class-instance-number** (page [366](#))

## Examples

Return the count of unit instances of `standard-space-instance`:

```
> (class-instances-count 'standard-space-instance)
8
>
```

Return the count of all space instance:

```
> (class-instances-count '(standard-space-instance :plus-subclasses))
14
>
```

or simply:

```
> (class-instances-count '(standard-space-instance +))
14
>
```

---

---

**define-unit-class** *unit-class-name* (*{superclass-name}*\*) (*{slot-specifier}*\*) *{class-option}*\* [*Macro*]  
⇒ *new-unit-class*

---

## Purpose

Define or redefine a unit class.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-class-name* A non-nil, non-keyword symbol that names the unit class  
*superclass-name* A non-nil, non-keyword symbol that specifies a direct superclass of the unit class  
*unit-class-name*  
*slot-specifiers* See below  
*class-options* See below  
*new-unit-class* A new or modified unit class object

## Returns

The newly defined or modified unit class object.

## Errors

The specified *superclass-names* do not include at least one unit class name. This error is signaled on class finalization.

## Detailed syntax

(Syntax shown in gray is not supported in GBBopen Version 1.5, but will become available in a future release.)

*slot-specifier* ::= *slot-name* |  
                  (*nonlink-slot-name* [*nonlink-slot-option*]) |  
                  (*link-slot-name* [*link-slot-option*])

dimension-value-place ::= {slot-name [slot-name]} | {function [slot-name]}
direct-slots-specifier ::= nil | t | included-slot-name* |
  {t :exclude excluded-slot-name*}

```

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eql`. The default *boolean-comparison-type* is `t`.

A *dimension-value-place* with two *slot-names* is allowed only for an `:interval` dimension-value specification.

## Terms

<i>class-name</i>	A non- <code>nil</code> , non-keyword symbol that names a class
<i>dimension-name</i>	A symbol specifying a dimension
<i>documentation</i>	A documentation string
<i>initarg-list</i>	An initialization argument list
<i>instance-name-comparison-test</i>	One of the four standardized hash table test function names: <code>eq</code> , <code>eql</code> , <code>equal</code> , or <code>equalp</code> (default for classes of metaclass <b>standard-unit-class</b> is <code>eql</code> )
<i>ordering-dimension-name</i>	A symbol specifying the ordering dimension used to order series-composite dimension values
<i>size-form</i>	An integer or an expression that evaluates to an integer (evaluation occurs whenever the unit class is initialized, reinitialized, or reset)
<i>slot-name</i>	A non- <code>nil</code> , non-keyword symbol

## Description

A *dimension-value-place* with two *slot-names* can be specified only for `:interval` dimension-value types.

If *dimension-value-place* is specified as a *function* without a qualifying *slot-name*, *function* is called with the unit instance rather than a slot value. In this case, *function* is responsible for handling any unbound slots that it references, returning **unbound-value-indicator** when appropriate.

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class **standard-unit-instance**.

The `:metaclass` class option, if specified, must be a subclass of **standard-unit-class**. The default metaclass value is **standard-unit-class**.

## Inheritance of class options

The set of *dimensional-values* for a unit class is the union of the sets specified in the *dimensional-values* options of the class and its superclasses. When more than one dimension-value specification is supplied for a given dimension, the one supplied by the most specific class is used.

The effective *initial-space-instances* value for a unit class is the value specified in the definition of the most specific unit class. (No additive inheritance of *initial-space-instances* is performed.) If no definitions specify an *initial-space-instances* value, `nil` is used.

The *instance-name-comparison-test* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

If a *retain* value is not specified, a value of `:propagate` is used as the default if any parent unit classes have a `:propagate` retention value; otherwise `nil` is used as the default value.

The *use-global-instance-name-counter* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

## Examples

Define a unit class, `hyp`, that illustrates a number of **define-unit-class** capabilities:

```
> (define-unit-class hyp ()
  ((belief :initform 0.0)
   (location :initform nil)
   (velocity-range)
   (color)
   (classification :initform '(:car :truck :bus :motorcycle :train
:duck-boat
                                :lawn-mower :anything))
  (supporting-hyps
   :link (hyp supported-hyps))
  (supported-hyps
   :link (hyp supporting-hyps)))
(:dimensional-values
 (belief :point belief)
 (velocity-range :interval velocity-range)
 (color (:element eq) color)
 (classification (:element eq) :set classification)
 (x (:point fixnum) #'location.x location)
 (y (:point fixnum) #'location.y location))
 (:initial-space-instances (bb hyps)))
#<standard-unit-class hyp>
>
```

Define a unit class, `word`, whose instances are indexed by the word's individual characters in an enumerated dimension and the **code-char** values of the individual characters in an ordered dimension:

```
> (define-unit-class word ()
  ((string :initform "what's"))
  (:dimensional-values
   (character :element :set string)
   (char-code (:point fixnum) :set
    #'(lambda (string)
        (map 'list #'char-code string))
    string))
  (:initial-space-instances (words)))
#<standard-unit-class word>
>
```

## Purpose

Delete a unit instance.

## Method signatures

`delete-instance` (*unit-instance* *deleted-unit-instance*) ⇒ *deleted-unit-instance*

`delete-instance` (*unit-instance* *standard-unit-instance*) ⇒ *deleted-unit-instance*

`delete-instance` (*space-instance* *standard-space-instance*) ⇒ *deleted-unit-instance*

**Package** : `gbbopen`

**Module** : `gbbopen-core`

## Arguments

*unit-instance* The unit instance (or space instance) to be deleted

*deleted-unit-instance* The deleted *unit-instance* object, whose class has been changed to a **deleted-unit-instance** unless **\*skip-deleted-unit-instance-class-change\*** is true

## Returns

The deleted instance *deleted-unit-instance*.

## Events

A `delete-instance-event` is signaled at the start of the deletion process and an `instance-deleted-event` is signaled when the deletion has been completed. The following events may also be signaled:

- `unlink-event`
- `instance-removed-from-space-instance-event`

## Description

If **\*skip-deleted-unit-instance-class-change\*** is `nil`, the generic function **deleted-instance-class** is called by **delete-instance** to determine the class to be used as the changed class for the *deleted-unit-instance*.

## See also

<b>*skip-deleted-unit-instance-class-change*</b>	(page <a href="#">324</a> )
<b>delete-all-space-instances</b>	(page <a href="#">444</a> )
<b>delete-blackboard-repository</b>	(page <a href="#">442</a> )
<b>delete-space-instance</b>	(page <a href="#">445</a> )
<b>deleted-instance-class</b>	(page <a href="#">336</a> )
<b>deleted-unit-instance</b>	(page <a href="#">337</a> )
<b>make-instance</b>	(page <a href="#">364</a> )
<b>reset-gbbopen</b>	(page <a href="#">461</a> )
<b>reset-unit-class</b>	(page <a href="#">367</a> )

## Example

Create, then delete, a hyp unit instance:

```
> (delete-instance (make-instance 'hyp :location '(896 388) :belief .68))
#<deleted-unit-instance hyp 311>
>
```

---

**delete-instance**

---

## Purpose

Return the class to be used for a deleted unit instance.

## Method signatures

```
deleted-instance-class (unit-instance standard-unit-instance) ⇒  
    #<standard-class deleted-unit-instance>
```

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-instance* The unit instance (or space instance) to be deleted

*class* A class or a non-`nil`, non-keyword symbol that names a class (the default method returns the class **deleted-unit-instance**)

## Returns

The class or symbol naming the class to be used as the changed class for the deleted instance.

## Description

This generic function is called by **delete-instance** to determine the class to be used as the changed class for a deleted unit instance. The returned *class* must be a subclass of **deleted-unit-instance**, but it must not be a subclass of **standard-unit-instance**.

## See also

**delete-instance** (page [334](#))

**deleted-unit-instance** (page [337](#))

## Example

Define a class to be used for deleted `hyp` unit instances and a **deleted-instance-class** method to use `deleted-hyp` as the class for deleted `hyp` (and subclasses of `hyp`) unit instances:

```
> (define-class deleted-hyp (deleted-unit-instance)  
    (location  
     classification  
     supporting-hyps)  
    #<standard-class deleted-hyp>  
> (defmethod deleted-instance-class ((hyp hyp))  
    (load-time-value (find-class 'deleted-hyp)))  
deleted-instance-class  
>
```

---

**deleted-unit-instance**

[Class]

---

**Package** :gbbopen

**Module** :gbbopen-core

### Description

The class **deleted-unit-instance** is an instance of **standard-class** and an instance of **deleted-unit-instance** represents a deleted unit instance or space instance. It is a subclass of **standard-gbbopen-instance**.

### See also

**delete-instance** (page [334](#))

**standard-gbbopen-instance** (page [126](#))

**standard-space-instance** (page [464](#))

**standard-unit-instance** (page [370](#))

---

## Purpose

Describe a unit instance (or a space instance, as a unit instance).

## Method signatures

`describe-instance` (*unit-instance* standard-unit-instance) &optional *stream*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance (or space instance)

*stream* A stream (default is `*standard-output*`)

## Description

The description is printed to the output *stream*.

## See also

**describe-instance-slot-value** (page [340](#))

**describe-space-instance** (page [448](#))

**describe-space-instance-storage** (page [449](#))

**make-instance** (page [364](#))

**make-space-instance** (page [455](#))

## Example

Describe the hyp unit instance:

```
> (describe-instance hyp)
Hyp #<hyp 419 (1835 4791) 0.85 [5..35]>
  Instance name: 419
  Space instances: ((bb hyps))
  Dimensional values:
    belief: 0.85
    classification: (:car :truck)
    color: :red
    velocity-range: (5 35)
    x: 1835
    y: 4791
  Non-link slots:
    belief: 0.85
    classification: (:car :truck)
    color: :red
    location: (1835 4791)
    velocity-range: (5 35)
  Link slots:
    supported-hyps: nil
```

```
    supporting-hyps: (#<hyp 183 (1835 4791) 0.82 [0..35]>
                    #<hyp 233 (1835 4791) 0.89 [5..35]>)
  Space instances: (#<standard-space-instance (bb hyps)>)
>
```

### REPL Note

**Describe-instance** can be invoked using the REPL command:

```
:di instance | {instance-name [unit-classes-specifier]}
```

which also sets = to the described unit instance.

---

**describe-instance**

---

**describe-instance-slot-value** *unit-instance slot-name value*  
&optional *stream*

---

[Generic Function]

## Purpose

Customize slot-value printing by **describe-instance**.

## Method signatures

**describe-instance-slot-value** (*unit-instance* standard-unit-instance) *slot-name value*  
&optional *stream*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance (or space instance)  
*slot-name* A non-nil, non-keyword symbol  
*value* An object  
*stream* A stream (default is \*standard-output\*)

## Description

**Describe-instance-slot-value** is called by **describe-instance** to print each slot value; it should not be called directly. The slot-value representation is printed to the output *stream*.

## See also

**describe-instance** (page [338](#))

## Example

Describe the `observation-duration` slot of a `hyp` unit instance as a human-readable duration:

```
(defmethod describe-instance-slot-value
  ((hyp hyp)
   (slot-name (eql 'observation-duration)) value
   &optional (stream *standard-output*))
  (if value
    (pretty-duration duration 5 stream)
    (prin1 nil stream)))
```

## Purpose

Print information about a unit class.

## Method signatures

describe-unit-class (*unit-class-name* symbol)

describe-unit-class (*unit-class-specifier* cons)

describe-unit-class (*unit-class* standard-unit-class)

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-class-name* A unit-class or an extended unit-classes specification (see below)

## Detailed syntax

*unit-classes-specifier* ::= t | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The description is printed to the **\*standard-output\*** stream.

## Example

```
> (describe-unit-class 'hyp)
Standard-unit-class #<standard-unit-class hyp>
Direct superclasses:
  standard-unit-instance (abstract)
Direct subclasses: None
Direct nonlink slots:

```

---

**describe-unit-class**

---

**dimensions-of** *space-instance-or-unit-classes-specifier*  
⇒ *dimension-specifications-list*

---

[Generic Function]

## Purpose

Return the dimension specifications of a space instance or one or more unit classes.

## Method signatures

`dimensions-of` (*space-instance* `standard-space-instance`) ⇒ *dimension-specifications-list*

`dimensions-of` (*unit-classes-specifier* `cons`) ⇒ *dimension-specifications-list*

`dimensions-of` (*unit-class* `standard-unit-class`) ⇒ *dimension-specifications-list*

**Package** : `gbbopen`

**Module** : `gbbopen-core`

## Arguments

*space-instance-or-unit-classes-specifier* A space instance, an extended unit-classes specification or a list of extended unit-classes specifications

*dimension-specifications-list* A proper list

## Returns

A list of (`dimension-name` (`dimension-type` `comparison-type`)) **pairs**.

## See also

**define-unit-class** (page [330](#))

**make-space-instance** (page [455](#))

**instance-dimension-value** (page [354](#))

**instance-dimension-values** (page [356](#))

## Examples

Return the dimensions defined for instances of unit class `hyp`:

```
> (dimensions-of 'hyp)
((x (:ordered fixnum)) (y (:ordered fixnum)) (belief (:ordered number))
 (velocity-range (:ordered number)) (color (:enumerated eq))
 (classification (:enumerated eq)))
>
```

Return the dimensions of the `(bb hys)` space instance:

```
> (dimensions-of (find-space-instance-by-path '(bb hys)))
((x (:ordered fixnum)) (y (:ordered fixnum)) (belief (:ordered number))
 (velocity-range (:ordered number)) (color (:enumerated eq))
 (classification (:enumerated eq)))
>
```

Note that the dimensions of a space instance (its dimensional extent as a container for other unit instances) is independent of any dimension values that the space instance might have as a unit instance:

```
> (instance-dimension-values (class-of (find-space-instance-by-path '(bb
hyps))))
nil
>
```

or the dimensions that the unit class of the space instance might have:

```
> (dimensions-of (class-of (find-space-instance-by-path '(bb hyps))))
nil
>
```

### Note

The returned list of dimension specifications for a space instance or for a unit class should not be destructively altered.

**Package** : gbbopen

**Module** : gbbopen-core

### Description

The class **direct-nolink-slot-definition** is the default direct nolink-slot-definition metaobject class of unit classes created by **define-unit-class**. **Direct-nolink-slot-definition** is a subclass of **gbbopen-direct-slot-definition**.

### See also

---

---

**gbbopen-effective-slot-definition**

---

*[Metaobject Class]***Package** :gbbopen**Module** :gbbopen-core**Description**

The class **gbbopen-effective-slot-definition** is the parent class of [effective-link-definition](#) and [effective-nonlink-slot-definition](#).

**See also****effective-link-definition** (page [380](#))**effective-nonlink-slot-definition** (page [347](#))**gbbopen-direct-slot-definition** (page [348](#))

---

---

**gbbopen-implementation-version** <no arguments> ⇒ *string*

---

[*Function*]

### **Purpose**

Return the GBBopen implementation version.

**Package** :gbbopen

**Module** :gbbopen-core

### **Arguments**

*string* A string

### **Returns**

The GBBopen implementation-version string

### **Example**

Return the GBBopen implementation-version string:

```
> (gbbopen-implementation-version)
"1.0"
>
```

---

**incomplete-instance-p** *unit-instance* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a unit instance is incomplete.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance

*boolean* A generalized boolean

## Returns

True if the unit instance is incomplete; nil otherwise.

## See also

**instance-deleted-p** (page [353](#))

## Example

Define an event function that recomputes the area of a complete unit instance when the value of its height or width slot changes:

```
(defun update-area-evfn (event-name
                        &key instance
                        &allow-other-keys)
  (declare (ignore event-name))
  ;; Do not compute the area of an incomplete instance:
  (unless (incomplete-instance instance)
    (setf (area-of instance)
          (* (width-of instance) (height-of instance))))

  (add-event-function 'update-area-evfn
                     'rectangle
                     :slot-names '(width height)))
```

---

---

**initial-class-instance-number** *unit-class-name-or-instance* ⇒ *integer*

---

[*Generic Function*]

## Purpose

Return the initial instance-name counter value associated with a unit class.

## Method signatures

**initial-class-instance-number** (*unit-class-name* *symbol*) ⇒ *integer*

**initial-class-instance-number** (*unit-instance* *standard-unit-instance*) ⇒ 0

**Package** : *gbbopen*

**Module** : *gbbopen-core*

## Arguments

*unit-class-name-or-instance* A unit instance or a symbol naming a unit class

*integer* An integer

## Returns

The initial instance-name counter value associated with the unit class.

## See also

**next-class-instance-number** (page [366](#))

**make-instance** (page [364](#))

## Examples

Return the initial instance-name value associated with unit class *ksa*:

```
> (initial-class-instance-number 'ksa)
0
>
```

## Note

The initial instance-name value associated with a unit class is not used if the `:use-global-instance-name-counter` class option is true for the unit class.

---

---

**instance-deleted-p** *unit-instance* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a unit instance has been deleted.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance

*boolean* A generalized boolean

## Returns

True if the unit instance is deleted; `nil` otherwise.

## See also

**\*skip-deleted-unit-instance-class-change\*** (page [324](#))

**check-for-deleted-instance** (page [327](#))

**delete-instance** (page [334](#))

**incomplete-instance-p** (page [351](#))

## Example

Create, then delete, then check, a `hyp` unit instance:

```
> (instance-deleted-p (delete-instance (make-instance 'hyp)))  
t  
>
```

---

**instance-dimension-value** *unit-instance dimension-name* [Function]  
⇒ *dimension-value, dimension-value-type, comparison-type, composite-type, ordering-*

---

## Purpose

Obtain a dimension value of a unit instance.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance

*dimension-name* A symbol specifying a dimension of *unit-instance*

*dimension-value* An object

*dimension-value-type* One of: `:point`, `:interval`, `:mixed`, `:element`, or `:boolean`

*comparison-type* One of: `number`, `fixnum`, `short-float`, `single-float`, `double-float`, `long-float`, or `pseudo-probability`

*composite-type* One of: `:set`, `:sequence`, `(:ascending-series ordering-dimension-name)`, `(:descending-series ordering-dimension-name)`, or `nil`

*ordering-dimension-name* A non-keyword symbol or `nil`

## Returns

Five values:

- the dimension value of the *unit-instance* in the specified dimension
- the dimension-value type of the specified dimension
- the comparison type of the specified dimension
- the composite type of the dimension value if it is a composite dimension value; `nil` if it is an incomposite dimension value
- the name of the ordering dimension, if the dimension value is a series-composite dimension value; `nil` otherwise

## Errors

The dimension *dimension-name* is not defined for *unit-instance*.

## See also

**define-unit-class** (page [330](#))

**dimensions-of** (page [344](#))

**instance-dimension-values** (page [356](#))

**make-instance** (page [364](#))

## Examples

Return the *x* dimension value of the unit instance, `hyp`:

```
> (instance-dimension-value hyp 'x)
1835
:point
:fixnum
```

```
nil
nil
>
```

**and its classification dimension value:**

```
> (instance-dimension-value hyp 'classification)
(:car :truck)
:element
eq
:set
nil
>
```

**Return the character dimension value of the unit instance, word:**

```
> (instance-dimension-value w 'character)
"what's"
:element
eql
:set
nil
>
```

**and its char-code dimension value:**

```
> (instance-dimension-value word 'char-code)
(119 104 97 116 39 115)
:point
fixnum
:set
nil
>
```

---

**instance-dimension-values** *unit-instance* &optional *dimension-names*  
⇒ *dimension-values-alist*

---

[Function]

## Purpose

Return dimension values of a unit instance.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance

*dimension-names* A list of symbols naming dimensions of *unit-instance* or  $\tau$ , indicating all dimensions of *unit-instance* (default is  $\tau$ )

*dimension-values-alist* An association list

## Returns

An association list of dimension name and dimension value pairs.

## Errors

A dimension name specified in *dimension-names* is not defined for *unit-instance*.

## See also

**define-unit-class** (page [330](#))

**dimensions-of** (page [344](#))

**instance-dimension-value** (page [354](#))

**make-instance** (page [364](#))

## Examples

Return all dimension values of the unit instance, hyp:

```
> (instance-dimension-values hyp)
((belief . 0.85) (velocity-range 5 35) (color . :red)
 (classification :car :truck) (x . 1835) (y . 4791))
>
```

Return the x and y dimension values of the unit instance, hyp:

```
> (instance-dimension-values hyp '(x y))
((x . 1835) (y . 4791))
>
```

Return all dimension values of the unit instance, word:

```
> (instance-dimension-values word)
((character . "what's") (char-code 119 104 97 116 39 115))
>
```

## Note

Using **instance-dimension-value** is preferable to using **instance-dimension-values** when obtaining individual dimension values of a unit instance.

---

---

**instance-name-of** *unit-instance* ⇒ *instance-name*

---

[*Generic Accessor*]

## Purpose

Return the instance name of a unit instance.

## Self syntax

(setf (instance-name-of *instance*) *instance-name*) ⇒ *instance-name*

## Method signatures

instance-name-of (*unit-instance* standard-event-instance) ⇒ *instance-name*

instance-name-of (*unit-instance* standard-unit-instance) ⇒ *instance-name*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance or an event instance

*instance-name* An object

## Returns

The instance name of the *unit-instance*.

## Errors

The supplied *instance-name* provided to (**setf instance-name-of**) is identical to the instance name of an existing unit instance of the same class as *unit-instance*.

## See also

**make-instance** (page [364](#))

## Examples

Return the instance names of the unit instances supporting hyp unit instance 180:

```
> (mapcar #'instance-name-of
         (supporting-hyps-of (find-instance-by-name 'hyp 180)))
(123 158 94)
>
```

Change the instance name of hyp 180 to "bogus-180":

```
> (setf (instance-name-of (find-instance-by-name 180 'hyp)) "bogus-180")
"bogus-180"
>
```

---

**make-duplicate-instance** *instance unduplicated-slot-names* &rest *initargs* [Generic Function]  
&key &allow-other-keys ⇒ *new-instance, slots*

---

## Purpose

Create a duplicate instance of *instance*.

## Method signatures

**make-duplicate-instance** (*instance* standard-object) *unduplicated-slot-names* &rest *initargs*  
⇒ *new-instance, slots*

**make-duplicate-instance** (*instance* standard-space-instance) *unduplicated-slot-names* &rest  
*initargs* ⇒ *new-instance, slots*

**make-duplicate-instance** (*instance* standard-unit-instance) *unduplicated-slot-names* &rest  
*initargs* ⇒ *new-instance, slots*

**make-duplicate-instance** :around (*instance* standard-unit-instance) *unduplicated-slot-names*  
&rest *initargs* ⇒ *new-instance, slots*

**Package** : gbbopen-tools (re-exported by :gbbopen)

**Module** : gbbopen-tools (the unit-instance and space-instance methods are added by  
:gbbopen-core)

## Arguments

*instance* A standard-object instance

*unduplicated-slot-names* A list of slot names

*initargs* An initialization argument list

*new-instance* A standard-object instance

*slots* A proper list of slot objects

## Returns

Two values: the (newly created) duplicate instance and a list of the slots that were duplicated or explicitly initialized.

## Events

When a unit instance is duplicated, events are signaled in the following sequence:

1. An `nonlink-slot-updated-event` or `link-event` is signaled for each initialized slot in the duplicated unit instance. A `link-event` is also signaled for each inverse pointer from an existing unit instance to the (newly created) duplicate unit instance.
2. An `instance-added-to-space-instance-event` is signaled for each space instance on which the duplicate unit instance is added.
3. A `instance-created-event` is signaled.

## Errors

Use of an initialization argument that has not been declared as valid.

## Description

Slot initialization during instance duplication behaves as follows, regardless of whether the slots are local or shared:

- If an `initarg` in `initargs` specifies a value for a slot, that value is stored into the slot in the duplicated instance.
- All slots in the duplicated instance that are unbound at this point and that are not named in `unduplicated-slot-names` or in the list of slot-names returned from calling **unduplicated-slot-names** on `instance` are set to the value of the slot in `instance`.
- Any slots that remain unbound and are named in `unduplicated-slot-names` or in the list of slot-names returned from calling **unduplicated-slot-names** on `instance` are initialized according to their `:initform` forms.

When duplicating a unit instance, specifying a `:instance-name` initialization argument causes that value to be used as the instance name of the newly created unit instance instead of the instance-name counter value associated with the unit class (if the `:use-global-instance-name-counter` class option is `nil` or was not specified for the unit class) or the global instance-name counter value (if the `:use-global-instance-name-counter` class option is `true` for the unit class).

A `:space-instances` initialization argument must be provided when duplicating a space instance.

## Examples

Create some simple duplicate instances:

```
> (define-class foo ()
    ((a :initform 1)
     (b :initform 2)))
#<standard-class foo>
> (defparameter *x* (make-instance 'foo :a 11 :b 12))
*x*
> :ds *x*
#<foo #x110fe6ea> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
  a  11
  b  12
> :ds (make-duplicate-instance *x* nil :a -1)
#<foo #x110ff93a> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
  a  -1
  b  12
> :ds (make-duplicate-instance *x* '(b) :a -1)
#<foo #x11104542> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
```

```
a -1
b 2
> :ds (make-duplicate-instance *x* '(b))
#<foo #x11108c82> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
a 11
b 2
> (make-duplicate-instance *x* nil)
#<foo @ #x1110a0e2>
(#<standard-effective-slot-definition b>
 #<standard-effective-slot-definition a>)
>
```

**Create a duplicate of the hyp 419 unit instance:**

```
> (make-duplicate-instance (find-instance-by-name 19 'hyp) nil)
#<hyp 681 (1835 4791) 0.85 [5..35]>
>
```

---

## make-duplicate-instance

---

**make-duplicate-instance-changing-class** *instance new-class* [Generic Function]  
*unduplicated-slot-names*  
&rest *initargs*  
&key &allow-other-keys  
⇒ *new-instance, slots*

---

## Purpose

Create a duplicate instance of *instance*, changing its class to *new-class* in the process.

## Method signatures

**make-duplicate-instance-changing-class** (*instance* standard-object) (*new-class* class)  
*unduplicated-slot-names* &rest *initargs*  
⇒ *new-instance, slots*

**make-duplicate-instance-changing-class** (*instance* standard-object) (*new-class*  
standard-space-class) *unduplicated-slot-names* &rest  
*initargs* ⇒ *new-space-instance, slots*

**make-duplicate-instance-changing-class** (*instance* standard-object) (*new-class*  
standard-unit-class) *unduplicated-slot-names* &rest  
*initargs* ⇒ *new-unit-instance, slots*

**make-duplicate-instance-changing-class** (*instance* standard-object) (*new-class* symbol)  
*unduplicated-slot-names* &rest *initargs*  
⇒ *new-instance, slots*

**make-duplicate-instance-changing-class** :around (*instance* standard-unit-instance) (*new-class*  
standard-unit-class) *unduplicated-slot-names* &rest  
*initargs* ⇒ *new-unit-instance, slots*

**Package** : gbbopen-tools (re-exported by :gbbopen)

**Module** : gbbopen-tools (the unit-instance and space-instance methods are added by  
:gbbopen-core)

## Arguments

*instance* A standard-object instance  
*new-class* A class designator  
*unduplicated-slot-names* A list of slot names  
*initargs* An initialization argument list  
*new-instance* A standard-object instance  
*slots* A proper list of slot objects

## Returns

Two values: the (newly created) duplicate instance and a list of the slots that were duplicated or explicitly initialized.

## Events

When a unit instance is duplicated, events are signaled in the following sequence:

1. An `nonlink-slot-updated-event` or `link-event` is signaled for each initialized slot in the duplicated unit instance. A `link-event` is also signaled for each inverse pointer from an existing unit instance to the (newly created) duplicate unit instance.

2. An `instance-added-to-space-instance-event` is signaled for each space instance on which the duplicate unit instance is added.
3. A `instance-created-event` is signaled.

## Errors

Use of an initialization argument that has not been declared as valid.

## Description

Slot initialization during instance duplication behaves as follows, regardless of whether the slots are local or shared:

- If an `initarg` in `initargs` specifies a value for a slot, that value is stored into the slot in the duplicated instance.
- All slots in the duplicated instance that are unbound at this point and that are not named in `unduplicated-slot-names` or in the list of slot-names returned from calling **unduplicated-slot-names** on `instance` are set to the value of the slot in `instance`.
- Any slots that remain unbound at this point and that are defined for `new-class` instances but not for `instance` or are named in `unduplicated-slot-names` or in the list of slot-names returned from calling **unduplicated-slot-names** on `instance` are initialized according to their `:initform` forms.

When creating (duplicating) a new unit instance, specifying a `:instance-name` initialization argument causes that value to be used as the instance name of the newly created unit instance instead of the instance-name counter value associated with the unit class (if the `:use-global-instance-name-counter` class option is `nil` or was not specified for the unit class) or the global instance-name counter value (if the `:use-global-instance-name-counter` class option is `true` for the unit class).

A `:space-instances` initialization argument must be provided when creating a new a space instance.

## Examples

Create some simple duplicate instances:

```
> (define-class foo ()
    ((a :initform 1)
     (b :initform 2)))
#<standard-class foo>
> (define-unit-class bar ())
```

```
      ((a :initform 1)
       (b :initform 2)))
#<standard-class bar>
> (defparameter *** (make-instance 'foo :a 11 :b 12))
***
> :ds ***
#<foo #x1110fe6ea> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
  a  11
  b  12
> :ds (make-duplicate-instance-changing-class *** 'foo nil :a -1)
#<foo #x1110ff93a> is an instance of #<standard-class foo>:
The following slots have :instance allocation:
  a  -1
  b  12
> :ds (make-duplicate-instance-changing-class *** 'bar nil :b 2)
#<bar #x111100032> is an instance of #<standard-unit-class bar>:
The following slots have :instance allocation:
  a  11
  b  2
> :ds (make-duplicate-instance-changing-class *** 'bar '(b) :a -1)
#<bar #x111104542> is an instance of #<standard-unit-class bar>:
The following slots have :instance allocation:
  a  -1
  b  2
> :ds (make-duplicate-instance-changing-class *** 'bar '(b))
#<bar #x111108c82> is an instance of #<standard-unit-class foo>:
The following slots have :instance allocation:
  a  11
  b  2
> (make-duplicate-instance-changing-class *** 'bar nil)
#<bar @ #x11110a0e2>
(#<standard-effective-slot-definition b>
 #<standard-effective-slot-definition a>)
>
```

**Create a duplicate of the hyp 419 unit instance as a probable-hyp:**

```
> (make-duplicate-instance-changing-class
   (find-instance-by-name 19 'hyp)
   'possible-hyp nil)
#<possible-hyp 681 (1835 4791) 0.85 [5..35]>
>
```

---

**make-instance** *class* &rest *initargs* &key &allow-other-keys ⇒ *instance* [Generic Function]

---

## Purpose

Create a new instance of *class*, such as a new unit instance.

## Method signatures

make-instance (*class* standard-class) &rest *initargs* ⇒ *instance*

make-instance (*class* symbol) &rest *initargs* ⇒ *instance*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*class* A class designator

*initargs* An initialization argument list

*instance* A standard-object instance

## Returns

The newly created instance of *class*.

## Events

When a unit instance is created, events are signaled in the following sequence:

1. An `nonlink-slot-updated-event` or `link-event` is signaled for each initialized slot in the newly created unit instance. A `link-event` is also signaled for each inverse pointer from an existing unit instance to the newly created unit instance.
2. An `instance-added-to-space-instance-event` is signaled for each space instance on which the newly created unit instance is added.
3. A `instance-created-event` is signaled.

## Errors

Use of an initialization argument that has not been declared as valid.

If *class* is a unit class and the supplied or generated instance name is identical to the instance name of an existing unit instance of *class*.

## Description

Specifying a `:space-instances` initialization argument causes that value to be used instead of the `:initial-space-instances` specification associated with the unit class. Similarly, specifying a `:instance-name` initialization argument causes that value to be used as the instance name of the newly created unit instance instead of the instance-name counter value associated with the unit class (if the `:use-global-instance-name-counter` class option is `nil` or was not specified for the unit class) or the global instance-name counter value (if the `:use-global-instance-name-counter` class option is `true` for the unit class).

## See also

<b>change-class</b>	(page <a href="#">325</a> )
<b>define-event-class</b>	(page <a href="#">394</a> )
<b>define-unit-class</b>	(page <a href="#">330</a> )
<b>define-space-class</b>	(page <a href="#">438</a> )
<b>delete-instance</b>	(page <a href="#">334</a> )
<b>describe-instance</b>	(page <a href="#">338</a> )
<b>initial-class-instance-number</b>	(page <a href="#">352</a> )
<b>instance-name-of</b>	(page <a href="#">357</a> )
<b>make-duplicate-instance</b>	(page <a href="#">358</a> )
<b>make-duplicate-instance-changing-class</b>	(page <a href="#">361</a> )
<b>make-space-instance</b>	(page <a href="#">455</a> )
<b>next-class-instance-number</b>	(page <a href="#">366</a> )

## Example

Create a new hyp unit instance:

```
> (make-instance 'hyp
  :location (list x y)
  :classification '(:car :truck)
  :color ':gray
  :belief .85
  :velocity-range '(5 35)
  :supporting-hyps supporting-hyps)
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

## Note

The function [make-space-instance](#) provides a clear and convenient shorthand for creating space instances.

---

**next-class-instance-number** *unit-class-name-or-instance* ⇒ *integer*

---

[*Generic Function*]

## Purpose

Increment and return the instance-name counter value associated with a unit class.

## Method signatures

**next-class-instance-number** (*unit-class-name* symbol) ⇒ *integer*

**next-class-instance-number** (*unit-instance* standard-unit-instance) ⇒ *integer*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-class-name-or-instance* A unit instance or a symbol naming a unit class

*integer* An integer

## Returns

The incremented instance-name counter value associated with the unit class.

## See also

**change-class** (page [325](#))

**class-instances-count** (page [329](#))

**initial-class-instance-number** (page [352](#))

**make-instance** (page [364](#))

## Examples

Increment and return the next instance-name number of unit instances of *ksa*:

```
> (next-class-instance-number 'ksa)
8
>
```

Change the class of unit instance *hyp* from *probable-hyp* to *rejected-hyp*:

```
> (change-class hyp 'rejected-hyp
   :instance-name (next-class-instance-number 'rejected-hyp))
#<rejected-hyp 1409 (896 388) .68>
>
```

Note that the `:instance-name` initarg can be eliminated if both the old and new classes for *hyp* are using the global instance-name counter.

## Note

The **next-class-instance-number** function increments the global instance-name counter value if the `:use-global-instance-name-counter` class option is true for the unit class.

---

## Purpose

Resets the unit-class instance-name counter of *unit-class* to its initial value.

## Method signatures

`reset-unit-class` (*unit-class-name* symbol)

`reset-unit-class` (*unit-class-specifier* cons)

`reset-unit-class` (*unit-class* standard-unit-instance)

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-class* A unit class

## Description

The unit-class instance-name counter of *unit-class* is reset to the value returned by calling **initial-class-instance-number** with *unit-class*, but only if the unit class is not abstract, if the `:use-global-instance-name-counter` class option is `nil` or was not specified for the unit class, and if there are no existing instances of that class. If instances do exist and the global instance-name counter is not being used for the unit class, a warning is issued.

## See also

**delete-blackboard-repository** (page [442](#))

**initial-class-instance-number** (page [352](#))

**reset-gbbopen** (page [461](#))

## Example

Reset the instance-name counters of all unit classes:

```
> (reset-unit-class 't)
;; Warning: Unit class standard-space-instance has 4 instances; not reset
>
```

Note that a warning was issued when resetting **standard-space-instance** because 4 space instances of that class exist.

---

---

**space-instances-of** *unit-instance* ⇒ *space-instances*

---

[Function]

### Purpose

Obtain the space instances on which a unit instance resides.

**Package** :gbbopen

**Module** :gbbopen-core

### Arguments

*unit-instance* A unit instance

*space-instances* A proper list

### Returns

The list of space instances on which *unit-instance* resides.

### Example

Return the space instances on which the unit instance, `unit-instance`, resides:

```
> (space-instances-of unit-instance)
(#<standard-space-instance (bb hyps)>)
>
```

### Note

The returned list of space instances should not be destructively altered.

---

**Package** :gbbopen

**Module** :gbbopen-core

### Description

The class **standard-unit-class** is the default class of classes defined by **define-unit-class**. It is a subclass of `standard-class`.

### See also

**define-unit-class** (page [330](#))

**deleted-unit-instance** (page [337](#))

**standard-unit-instance** (page [370](#))

**standard-space-class** (page [463](#))

---

**Package** : gbbopen

**Module** : gbbopen-core

### Description

The class **standard-unit-instance** is an instance of **standard-unit-class** and is a superclass of every unit class that is an instance of **standard-unit-class** except itself. It is a subclass of **standard-gbbopen-instance**.

A space instance is also a unit instance, so **standard-space-instance** is a superclass of **standard-unit-instance**.

### See also

**deleted-unit-instance** (page [337](#))

**print-instance-slots** (page [107](#))

**standard-gbbopen-instance** (page [126](#))

**standard-space-instance** (page [464](#))

**standard-unit-class** (page [369](#))

---

---

**unduplicated-slot-names** *instance* ⇒ *unduplicated-slot-names*

---

[*Generic Function*]

## Purpose

Add slot names of a class to the list of slots that are not duplicated by **make-duplicate-instance** and **make-duplicate-instance-changing-class**.

## Method signatures

`unduplicated-slot-names` (*instance* standard-object) ⇒ nil

`unduplicated-slot-names` (*instance* standard-space-instance) ⇒ *unduplicated-slot-names*

`unduplicated-slot-names` (*instance* standard-unit-instance) ⇒ *unduplicated-slot-names*

**Package** :gbbopen-tools (re-exported by :gbbopen)

**Module** :gbbopen-tools (the `unit-instance` and `space-instance` methods are added by :gbbopen-core)

## Arguments

*instance* A standard-object instance

*unduplicated-slot-names* A proper list

## Returns

A list of unduplicated slot names for the class of *instance*.

## See also

**make-duplicate-instance** (page [358](#))

**make-duplicate-instance-changing-class** (page [361](#))

## Example

Specify that slot `complex-unsaved-slot` in `my-unit-instance` should be added to the list of slots that are not duplicated by **make-duplicate-instance** and **make-duplicate-instance-changing-class**:

```
(defmethod unduplicated-slot-names ((instance my-unit-instance))
  (cons 'complex-unsaved-slot (call-next-method)))
```

---

**with-changing-dimension-values** (*unit-instance* [*dimension-name*\*]) *declaration*\* [Macro]  
*form*\*  $\Rightarrow$  *result*\*

---

## Purpose

Inform GBBopen that the dimension values of a unit instance potentially will be changed by the evaluation of *forms*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*unit-instance* A unit instance  
*dimension-name* A symbol specifying a dimension of *unit-instance*  
*declaration* A declare expression (not evaluated)  
*forms* An implicit **progn** of forms to be evaluated  
*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Description

The locators for *unit-instance* are updated following the evaluation of the last *form*. Any retrieval operations performed during the evaluation of *forms* will use the *unit-instance* locators as they existed before evaluation of the first *form*. Retrievals performed by separate threads also should be synchronized when using **with-changing-dimension-values**.

If *dimension-names* are specified, only the locators for those dimensions of *unit-instance* will be checked and updated as needed. If no *dimension-names* are specified, the values of any or all dimensions of *unit-instance* are assumed to have been potentially changed by *forms*.

## See also

**check-instance-locators** (page [328](#))

## Examples

Notify GBBopen that the x, y, and belief dimension values of hyp might be changed:

```
> (with-changing-dimension-values (hyp x y belief)
   (setf (location-of hyp) '(30 40))
   (setf (belief-of hyp) 0.78))
0.78
>
```

Notify GBBopen that *some* dimension values of hyp might be changed (less efficient than the above, if hyp unit instances have many dimensions):

```
> (with-changing-dimension-values (hyp)
   (setf (location-of hyp) '(36 52))
   (incf (belief-of hyp) 0.05))
0.83
>
```

## 5.1 Links

This section contains `:gbbopen-core` entities that pertain to links. A link represents a bi-directional relationship between two unit instances using an outgoing pointer at each unit instance pointing to the other. GBBopen’s link operators maintain the bi-directional consistency of link pointers.

GBBopen also allows a link-pointer object to be used as an outgoing link pointer. An application developer can define a link-pointer object to hold attributes (such as “confidence” or “applicability conditions”) that are associated with the outgoing pointer.

Attributes of a link relationship that are not directional (attributes that are to be the same when obtained from either side of the link), are best represented by representing the “link” as a first-class unit instance rather than by maintaining a link-pointer object on each end of the link that have consistent values.

## Purpose

Check the link slots of all unit instances for bi-directional consistency.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*silentp* A generalized boolean (default is *nil*)

*errorp* A generalized boolean (default is *nil*)

*problem-count* An integer

## Returns

The number of inconsistent links encountered.

## Description

GBBopen automatically maintains bidirectional relationship consistency all link-slot definitions are consistent. (Definitional consistency can be checked with **check-link-definitions**). Unintended destructive list modification of the value of a link slot (for example, using `sort` without a protective `copy-list`) can break this consistency. **Check-all-instance-links** detects link inconsistencies and, when *errorp* is true, assist in repairing them.

If a link inconsistency is found, details of the inconsistency are printed to *\*standard-output\**.

If *silentp* is true, warning and summary messages are not printed. If *silentp* is *nil* and *errorp* is true, a correctable error is signaled if a link inconsistency is found.

## See also

**check-link-definitions** (page [377](#))

## Examples

Check that all instance links are consistent:

```
> (check-all-instance-links)
;; All instance links are consistent.
0
>
```

Check again, silently:

```
> (check-all-instance-links 't)
0
>
```

The result of checking when something has set the `next-location` link slot in `location 20` to `nil`:

```
> (check-all-instance-links)
Warning: Inverse link back to #<location 21 (32 37)> (link-slot
previous-location)
```

```
    from #<location 20 (28 28)> is missing in link-slot next-location
;; 1 problem was found.
1
>
```

Repeat, but with *errorp* true to prompt for automated repair of each problem:

```
> (check-all-instance-links nil 't)
Error: Inverse link back to #<location 21 (32 37)> (link-slot
previous-location)
    from #<location 20 (28 28)> is missing in link-slot next-location
Restart actions (select using :c n):
  0: Fix the inconsistency.
>> :c 0
;; Link to #<location 21 (32 37)> added.
;; 1 problem was found.
;; 1 repair was made.
1
> (check-all-instance-links)
;; All instance links are consistent.
0
>
```

---

## check-all-instance-links

## Purpose

Check for consistency among link-slot definitions of unit classes.

**Package** : *gbbopen*

**Module** : *gbbopen-core*

## Arguments

*silentp* A generalized boolean (default is *nil*)

*errorp* A generalized boolean (default is *nil*)

*boolean* A generalized boolean

## Returns

True if all link-slot definitions are consistent; *nil* otherwise.

## Description

If a link inconsistency is found, details of the inconsistency are printed to *\*standard-output\**. For clarity, only the first inconsistency is displayed. After the inconsistency has been repaired, **check-link-definitions** should be used again to check for additional inconsistencies.

If *silentp* is true, warning and success printing or error signaling is suppressed. If *silentp* is *nil* and *errorp* is true, an error is signaled if a link inconsistency is found.

## See also

**define-unit-class** (page [330](#))

**check-all-instance-links** (page [375](#))

## Examples

Check for consistency in link-slot definitions in all unit classes:

```
> (check-link-definitions)
;; All link definitions are consistent.
t
>
```

Create a link-slot inconsistency:

```
> (define-unit-class bad ()
  ((mismatched-link :link (missing inverse)))
  bad)
> (check-link-definitions)
;; Warning: The inverse of link MISMATCHED-LINK in unit-class BAD refers
;;         to unit-class MISSING, which is not defined.
nil
>
```

Check again, generating an error on the inconsistency:

```
> (check-link-definitions nil 't)
Error: The inverse of link MISMATCHED-LINK in unit-class BAD refers
      to unit-class MISSING, which is not defined.
>>
```

**Check again, silently:**

```
> (check-link-definitions 't)
nil
>
```

**Define the missing unit class, but incorrectly:**

```
> (define-unit-class missing () ((mismatched-link :link (missing bad))))
missing
> (check-link-definitions)
;; Warning: The inverse of link MISMATCHED-LINK in unit-class MISSING
;;         refers to link BAD which is not present in unit-class MISSING.
nil
>
```

**Fix the definition and check again:**

```
> (define-unit-class missing () ((inverse :link (bad mismatched-link))))
#<standard-unit-class missing>
> (check-link-definitions)
;; All link definitions are consistent.
t
>
```

**Check again, silently:**

```
> (check-link-definitions 't)
t
>
```

---

**check-link-definitions**

---

**direct-link-definition***[Metaobject Class]*

---

**Package** :gbbopen**Module** :gbbopen-core**Description**

The class **direct-link-definition** is the default direct link-definition metaobject class of unit classes created by [define-unit-class](#). **Direct-link-definition** is a subclass of [gbbopen-direct-slot-definition](#).

**See also**[effective-link-definition](#) (page [380](#))[direct-nonlink-slot-definition](#) (page [346](#))[gbbopen-direct-slot-definition](#) (page [348](#))

---

**Package** :gbbopen

**Module** :gbbopen-core

### Description

The class **effective-link-definition** is the default effective link-definition metaobject class of unit classes created by **define-unit-class**. **Effective-link-definition** is a subclass of **gbbopen-effective-slot-definition**.

### See also

**direct-link-definition** (page [379](#))

**effective-nonlink-slot-definition** (page [347](#))

**gbbopen-effective-slot-definition** (page [349](#))

---

## Purpose

Return the unit instance in an object that can be used as a link pointer.

## Self syntax

(setf (link-instance-of *object*) *unit-instance*) ⇒ *unit-instance*

## Method signatures

link-instance-of (*object* deleted/non-deleted-unit-instance) ⇒ *object*

link-instance-of (*object* standard-link-pointer) ⇒ *unit-instance*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*object* An object

*unit-instance* A unit instance

## Returns

The link pointer unit-instance.

## Description

The **link-instance-of** method on a unit instance returns its argument unit-instance object.

## See also

**linkf** (page [382](#))

**link-setf** (page [384](#))

**standard-link-pointer** (page [388](#))

**unlinkf** (page [389](#))

## Example

Define a link-pointer object class that can be used to associate a value with a link pointer:

```
(define-class link-ptr-with-value (standard-link-pointer)
  ((value :initform nil)))
```

and an informative **print-instance-slots** method:

```
(defmethod print-instance-slots ((obj link-ptr-with-value) stream)
  (call-next-method)
  (print-instance-slot-value obj 'value stream))
```

## Purpose

Add a link between a unit instance and one or more unit instances.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*link-slot-place* A form which is suitable for use as a generalized reference to a link slot  
*unit-instance-or-instances* A unit instance, a link-pointer object, or a list of unit instances and link-pointer objects

## Returns

The supplied *unit-instance-or-instances*.

## Events

A `link-event` is signaled for:

- all pointers that are added to the specified `link-slot-place`
- each inverse pointer of the link that is added to another unit instance

## Description

Adding a link from a unit instance to another unit instance that is already linked to that same unit instance is ignored.

## See also

**link-instance-of** (page [381](#))

**link-setf** (page [384](#))

**standard-link-pointer** (page [388](#))

**unlinkf** (page [389](#))

**unlinkf-all** (page [390](#))

## Examples

Add `support-hyp` to the supporting-hyps link slot of the hyp unit instance `unit-instance`:

```
> (linkf (supporting-hyps-of unit-instance) support-hyp)
#<hyp 231 (1488 7405) 0.63 [0..8]>
>
```

Note that, when a link pointer to `hyp 231` is already present in a link slot, adding a link to that same hyp unit instance—even as a link-pointer object—has no effect on the existing link pointer:

```
> (supporting-hyps-of unit-instance)
(#<hyp 231 (1488 7405) 0.63 [0..8]>)
> (linkf (supporting-hyps-of unit-instance)
      (make-instance 'link-ptr-with-value
                    :link-instance support-hyp))
```

```
      :value 0.9))
#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>
> (supporting-hyps-of unit-instance)
(#<hyp 231 (1488 7405) 0.63 [0..8]>)
>
```

**This time, add a link-pointer object as a new pointer:**

```
> (unlinkf-all (supporting-hyps-of unit-instance))
nil
> (linkf (supporting-hyps-of unit-instance)
      (make-instance 'link-ptr-with-value
                    :link-instance support-hyp
                    :value 0.9))
#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
>
```

---

## Purpose

Set *link-slot-place* to be precisely *unit-instance-or-instances* links between unit instance and *unit-instance-or-instances*.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*link-slot-place* A form which is suitable for use as a generalized reference to a link slot  
*unit-instance-or-instances* A unit instance, a link-pointer object, or a list of unit instances and link-pointer objects

## Returns

The supplied *unit-instance-or-instances*.

## Events

An `unlink-event` is signaled for:

- all pointers that are removed from the specified link-slot-place
- each inverse pointer of the link that is removed-from another unit instance

A `link-event` is signaled for:

- all pointers that are added to the specified link-slot-place (unlike **linkf**, this event is signaled even if no new pointers were added to link-slot-place)
- each inverse pointer of the link that is added to another unit instance

## Description

Any existing links in *link-slot-place* that do not involve *unit-instance-or-instances* are unlinked. Existing links that are also specified as link-pointer objects in *unit-instance-or-instances* are replaced with the new link-pointer objects. Then links to any additional unit instances in *unit-instance-or-instances* are added.

The order of the specified *unit-instance-or-instances* is maintained when setting the value of *link-slot-place*, if no `:sort-function` was specified as a *link-slot-option* in the unit-class definition for that link slot. Any duplicates in *unit-instance-or-instances* are removed, but the order of the remaining elements will be the same as the order in which they appeared in *unit-instance-or-instances*.

## See also

**link-instance-of** (page [381](#))

**linkf** (page [382](#))

**standard-link-pointer** (page [388](#))

**unlinkf** (page [389](#))

**unlinkf-all** (page [390](#))

## Examples

Set the supporting-hyps link slot of the hyp unit instance to the unit instances in supporting-hyps:

```
> (link-setf (supporting-hyps-of unit-instance) supporting-hyps)
#<hyp 231 (1488 7405) 0.63 [0..8]>
>
```

Note that, when a link pointer to hyp 231 is already present in a link slot, adding a link-pointer-object link to that same hyp unit instance replaces the existing link pointer:

```
> (supporting-hyps-of unit-instance)
(#<hyp 231 (1488 7405) 0.63 [0..8]>)
> (link-setf (supporting-hyps-of unit-instance)
      (make-instance 'link-ptr-with-value
                    :link-instance support-hyp
                    :value 0.9))
#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (value-of *)
0.9
>
```

Replace the existing link-pointer-object pointer with one that has a different value:

```
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (link-setf (supporting-hyps-of unit-instance)
      (make-instance 'link-ptr-with-value
                    :link-instance support-hyp
                    :value 0.94))
#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (value-of *)
0.94
>
```

Of course, a value change can also be done directly in an existing link-pointer object:

```
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (setf (value-of *) 0.96)
0.96
> (supporting-hyps-of unit-instance)
(#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (value-of *)
0.96
>
```

**Note**

The form `(link-setf link-slot-place nil)` is semantically equivalent to `(unlinkf-all link-slot-place)`. However, using **[unlinkf-all](#)** is preferable stylistically and slightly faster.

---

**link-setf**

---

**link-slot-p** *slot* ⇒ *slot-or-nil*

[*Generic Function*]

---

## Purpose

Determine if a slot meta-object is a link slot.

## Method signatures

`link-slot-p` (*slot* `direct-link-definition`) ⇒ *slot*

`link-slot-p` (*slot* `effective-link-definition`) ⇒ *slot*

`link-slot-p` (*slot* `slot-definition`) ⇒ `nil`

**Package** : `gbbopen`

**Module** : `gbbopen-core`

## Arguments

*slot* A slot meta object

*slot-or-nil* A slot meta object or `nil`

## Returns

The *slot* if it is a link slot; `nil` otherwise.

## See also

**define-unit-class** (page [330](#))

## Example

Return the names of the link slots of the `hyp` unit class:

```
> (loop for slot in (class-slots (find-class 'hyp))
      if (link-slot-p slot) collect (slot-definition-name slot))
(supporting-hyps supported-hyps)
>
```

**Package** :gbbopen

**Module** :gbbopen-core

### Description

The class **standard-link-pointer** is a subclass of **standard-gbbopen-instance** with one direct slot, `link-instance`, and the slot accessor, **link-instance-of**. **Standard-link-pointer** is a useful superclass for defining objects that can be used as a link pointer.

### See also

**linkf** (page [382](#))

**link-setf** (page [384](#))

**link-instance-of** (page [381](#))

**standard-gbbopen-instance** (page [126](#))

**unlinkf** (page [389](#))

### Example

Define a link-pointer object class that can be used to associate a value with a link pointer:

```
(define-class link-ptr-with-value (standard-link-pointer)
  ((value :initform nil)))
```

and an informative **print-instance-slots** method:

```
(defmethod print-instance-slots ((obj link-ptr-with-value) stream)
  (call-next-method)
  (print-instance-slot-value obj 'value stream))
```

---

---

**unlinkf** *link-slot-place unit-instance-or-instances* ⇒ *unit-instance-or-instances*

---

[*Macro*]

## Purpose

Remove a link between a unit instance and one or more unit instances.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*link-slot-place* A form which is suitable for use as a generalized reference to a link slot  
*unit-instance-or-instances* A unit instance, a link-pointer object, or a list of unit instances and link-pointer objects

## Returns

The supplied *unit-instance-or-instances*.

## Events

An `unlink-event` is signaled for:

- all pointers that are removed from the specified link-slot-place
- each inverse pointer of the link that is removed from another unit instance

## See also

**link-instance-of** (page [381](#))  
**linkf** (page [382](#))  
**link-setf** (page [384](#))  
**standard-link-pointer** (page [388](#))  
**unlinkf-all** (page [390](#))

## Examples

Remove `support-hyp` from the `supporting-hyps` link slot of the `hyp` unit instance  
unit-instance:

```
> (unlinkf (supporting-hyps-of unit-instance) support-hyp)
#<hyp 231 (1488 7405) 0.63 [0..8]>
>
```

The above, but this time showing that the `support-hyp` can be a link-pointer object:

```
> (linkf (supporting-hyps-of unit-instance) support-hyp)
#<hyp 231 (1488 7405) 0.63 [0..8]>
> (unlinkf (supporting-hyps-of unit-instance)
          (make-instance 'link-ptr-with-value
                        :link-instance support-hyp))
#<link-ptr-with-value #<hyp 231 (1488 7405) 0.63 [0..8]>
> (supporting-hyps-of unit-instance)
nil
>
```

---

**Purpose**

Remove all the links in the specified link slot.

**Package** :gbbopen

**Module** :gbbopen-core

**Arguments**

*link-slot-place* A form which is suitable for use as a generalized reference to a link slot

**Events**

An `unlink-event` is signaled for:

- all pointers that are removed from the specified `link-slot-place`
- each inverse pointer of the link that is removed from another unit instance

**See also**

**linkf** (page [382](#))

**link-setf** (page [384](#))

**unlinkf** (page [389](#))

**Example**

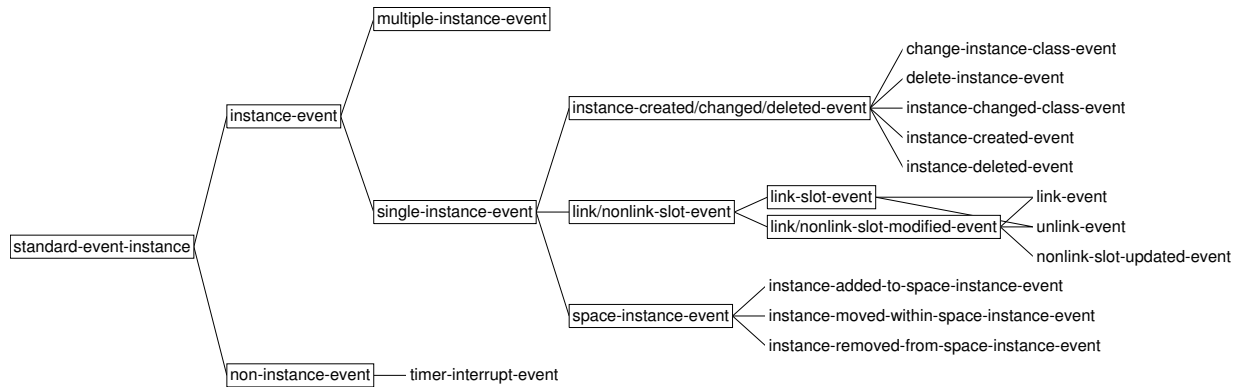

Remove all supporting hypothesis links from the `supporting-hyps` link slot of the `hyp` unit instance `unit-instance`:

```
> (unlinkf-all (supporting-hyps-of unit-instance))
nil
>
```

## 5.2 Events

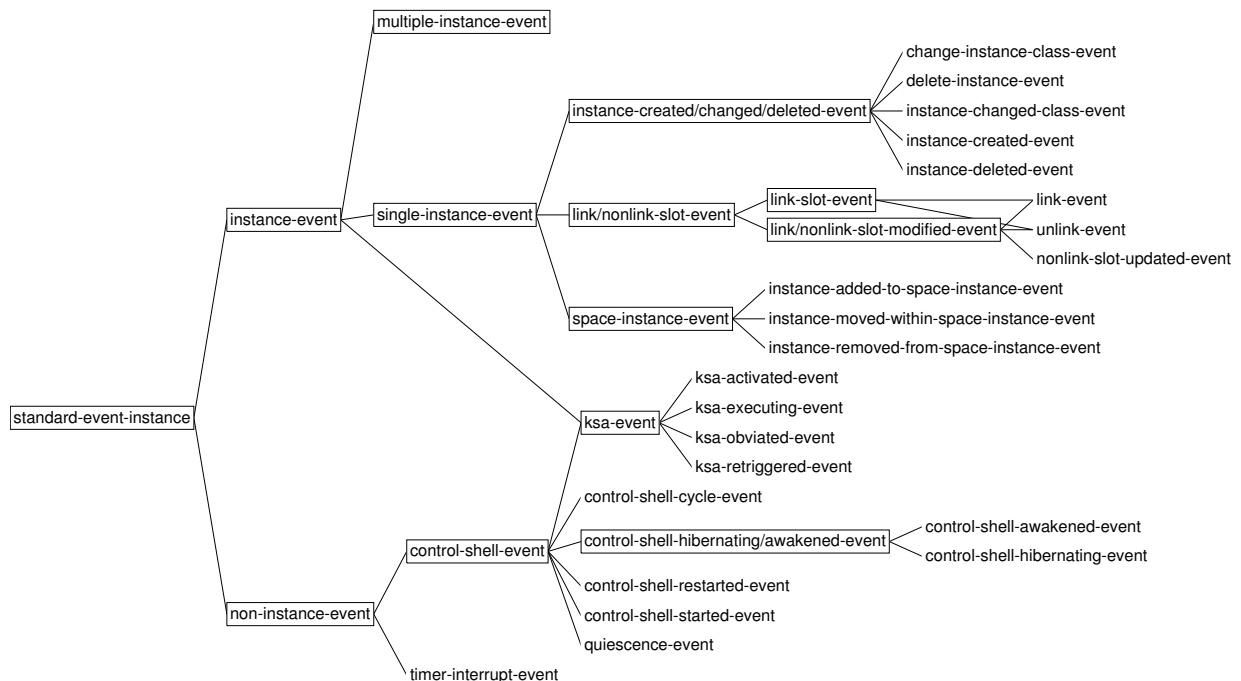

This section contains `:gbbopen-core` entities that pertain to events, event functions, event printing, and event signaling.

Here are the event subclasses of **standard-event-instance** that are defined in the `:gbbopen-core` module:

The event classes shown within rectangles are abstract classes that cannot be signaled.

Here are the defined event subclasses when both the `:gbbopen-core` and `:agenda-shell` modules have been loaded:

The additional `control-shell-event` classes are defined and signaled by the Agenda Shell. Again classes shown within rectangles are abstract classes that cannot be signaled.

---

**add-event-function** *function* [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
&key *slot-names paths permanent priority*

---

## Purpose

Add an event function for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

<i>function</i>	A function designator
<i>event-class-specifier</i>	An extended event-class specification (see below; default is <code>t</code> )
<i>unit-class-or-instance-specifier</i>	An extended unit-class or instance specification (see below; default is <code>t</code> )
<i>slot-names</i> or <i>slot-name</i>	A slot-name or list of slot-names (default is <code>t</code> )
<i>paths</i> or <i>path</i>	A space-instance path regular expression (default is <code>(*)</code> )
<i>permanent</i>	A generalized boolean (default is <code>nil</code> )
<i>priority</i>	An integer between -127 and 127, inclusive (default is 0)

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) | `t`  
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= `:plus-subevents` | `:no-subevents` + | =

The shorthand + subevents specifier is equivalent to `:plus-subevents` and = to `:no-subevents`.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
*atomic-unit-class* |  
(*atomic-unit-class* *subclassing-specifier*) | `t`

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | + | =

The shorthand + subclasses specifier is equivalent to `:plus-subclasses` and = to `:no-subclasses`.

## Description

The specified *function* must accept the arguments associated with every event class to which it is added. In addition, *function* should accept additional arguments that are associated with all subevents of the specified event classes. (This can be achieved by specifying `&allow-other-keys` in the lambda list of *function*.)

The *paths* argument is either the symbol `t` (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**remove-event-function** (page [405](#))

**remove-all-event-functions** (page [403](#))

## Examples

Add the event function `evfn-printv` to the set of functions to be invoked when `instance-created-event` is signaled on a `hyp` unit instance:

```
(add-event-function 'evfn-printv 'instance-created-event 'hyp)
```

Add the event function `evfn-printv` to the set of functions to be invoked when `instance-created-event` is signaled on a `hyp` unit instance or its subclasses:

```
(add-event-function 'evfn-printv 'instance-created-event '(hyp
:plus-subclasses))
```

or simply:

```
(add-event-function 'evfn-printv 'instance-created-event '(hyp +))
```

## Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

**add-event-function**

---

**define-event-class** *event-class-name* (*{superclass-name}*\*) (*{slot-specifier}*\*) [Macro]  
*{class-option}*\* ⇒ *new-event-class*

---

## Purpose

Define or redefine an event class.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*event-class-name* A non-nil, non-keyword symbol that names the event class

*superclass-name* A non-nil, non-keyword symbol that specifies a direct superclass of the event class  
*event-class-name*

*slot-specifiers* See below

*class-options* See below

*new-event-class* A new or modified event class object.

## Returns

The newly defined or modified event class object.

## Detailed syntax

*slot-specifier* ::= *slot-name* | (*slot-name* [*{slot-option}*])

*slot-option* ::= *{accessor reader-function-name}*\* |  
*{allocation allocation-type}* |  
*{documentation string}* |  
*{initarg initarg-name}*\* |  
*{initform form}* |  
*{reader reader-function-name}*\* |  
*{type type-specifier}* |  
*{writer writer-function-name}*\*

*class-option* ::= (*abstract boolean*) |  
(*default-initargs . initarg-list*) |  
(*documentation string*) |  
(*event-metaclass event-metaclass-specifier*) |  
(*event-printing event-printing-specifier/code*) |  
(*export-accessors boolean*) |  
(*export-class-name boolean*) |  
(*export-slot-names direct-slots-specifier*) |  
(*generate-accessors direct-slots-specifier*) |  
(*generate-accessors-format {prefix | suffix}*) |  
(*generate-accessors-prefix {string | symbol}*) |  
(*generate-accessors-suffix {string | symbol}*) |  
(*generate-initargs direct-slots-specifier*) |  
(*metaclass class-name*)

*event-metaclass-specifier* ::= *non-instance-event-class* | *instance-event-class* |  
*space-instance-event-class* |  
*nonlink-slot-event-class* | *link-slot-event-class*

```
direct-slots-specifier ::= nil | t | included-slot-name* |
                        {t :exclude excluded-slot-name*}
```

## Terms

*class-name* A non-nil, non-keyword symbol that names a class

*documentation* A documentation string

*initarg-list* An initialization argument list

*slot-name* A non-nil, non-keyword symbol

## Description

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class **standard-event-instance**.

The `:metaclass class-name` class option, if specified, must be a subclass of **standard-event-class**. The default metaclass value is the metaclass of the event superclasses of *event-class-name* if they all have the same metaclass. If the event superclasses have multiple metaclasses, the metaclass of *event-class-name* must be provided. The following table lists the compatible event-superclass metaclasses for each event metaclass:

Event Metaclass	Compatible Event-Superclass Metaclasses				
	non- instance	non- instance	space- instance	nonlink- slot	link- slot
non-instance-event-class	<b>X</b>				
instance-event-class	<b>X</b>	<b>X</b>			
space-instance-event-class	<b>X</b>	<b>X</b>	<b>X</b>		
nonlink-slot-event-class	<b>X</b>	<b>X</b>		<b>X</b>	
link-slot-event-class	<b>X</b>	<b>X</b>			<b>X</b>

The table in the documentation for **signal-event** lists the initialization arguments that are required when signaling an event. These required initialization arguments are based on the event metaclass of the event class of the event that is being signaled.

## See also

**signal-event** (page [409](#))

**standard-event-class** (page [410](#))

**standard-event-instance** (page [411](#))

**with-generate-accessors-format** (page [136](#))

## Example

```
> (define-event-class my-event (non-instance-event)
   ((my-event-arg1 :initform nil)
    (my-event-arg2 :initform nil)))
#<non-instance-event-class my-event>
>
```

## Example

Describe all event printing:

```
> (describe-event-printing 'instance-event)
instance-event
  standard-unit-instance
    uc-2 [suspended]
    uc-1 [suspended]
  ksa
  ks
  standard-space-instance
>
```

## Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

**describe-event-printing**

---

**disable-event-printing** [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
&key *slot-names paths*

---

## Purpose

Disable the printing of events for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

<i>event-class-specifier</i>	An extended event-class specification (see below; default is $\tau$ )
<i>unit-class-or-instance-specifier</i>	An extended unit-class or instance specification (see below; default is $\tau$ )
<i>slot-names</i> or <i>slot-name</i>	A slot-name or list of slot-names (default is $\tau$ )
<i>paths</i> or <i>path</i>	A space-instance path regular expression (default is $(*)$ )

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) |  $\tau$   
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= :plus-subevents | :no-subevents + | =

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
*atomic-unit-class* |  
(*atomic-unit-class* *subclassing-specifier*) |  $\tau$

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The *paths* argument is either the symbol  $\tau$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**describe-event-printing** (page [396](#))

**enable-event-printing** (page [400](#))

**resume-event-printing** (page [407](#))

**suspend-event-printing** (page [412](#))

## Example

Disable all event printing:

```
(disable-event-printing)
```

**Note**

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

**disable-event-printing**

---

**enable-event-printing** [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
    &key *slot-names paths*

---

## Purpose

Enable the printing of events for one or more event classes.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*event-class-specifier*           An extended event-class specification (see below; default is  $\tau$ )  
*unit-class-or-instance-specifier* An extended unit-class or instance specification (see below; default is  $\tau$ )  
*slot-names or slot-name*       A slot-name or list of slot-names (default is  $\tau$ )  
*paths or path*                 A space-instance path regular expression (default is  $(*)$ )

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class subeventing-specifier*) |  $\tau$   
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= :plus-subevents | :no-subevents + | =

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
  *atomic-unit-class* |  
  (*atomic-unit-class subclassing-specifier*) |  $\tau$

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The *paths* argument is either the symbol  $\tau$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**describe-event-printing** (page [396](#))

**disable-event-printing** (page [398](#))

**resume-event-printing** (page [407](#))

**suspend-event-printing** (page [412](#))

### Example

Enable event printing on all space-instance events of hyp unit instances:

```
(enable-event-printing '(space-instance-event :plus-subevents)
                       '(hyp :plus-subclasses))
```

or simply:

```
(enable-event-printing '(space-instance-event +) '(hyp +))
```

### Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

**enable-event-printing**

### Purpose

Assist debugging by printing forms and the results of evaluating them to `*trace-output*`.

**Package** :gbbopen

**Module** :gbbopen-core

### Arguments

*forms* An implicit **progn** of forms to be evaluated and printed

### Returns

The values returned by evaluating the last *form*.

### Description

Evaluates *forms*, printing the *form* and the result values of each evaluation to `*trace-output*`. Any *form* that is a string (before evaluation) is simply printed without enclosing double-quote characters.

### Examples

Add the event function `evfn-printv` to the set of functions to be invoked when `instance-created-event` is signaled on a `hyp` unit instance:

```
(add-event-function 'evfn-printv 'instance-created-event 'hyp)
```

---

---

**remove-all-event-functions** [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
&key *slot-names paths permanent*

---

## Purpose

Remove all event functions for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

<i>event-class-specifier</i>	An extended event-class specification (see below; default is <code>t</code> )
<i>unit-class-or-instance-specifier</i>	An extended unit-class or instance specification (see below; default is <code>t</code> )
<i>slot-names</i> or <i>slot-name</i>	A slot-name or list of slot-names (default is <code>t</code> )
<i>paths</i> or <i>path</i>	A space-instance path regular expression (default is <code>(*)</code> )
<i>permanent</i>	A generalized boolean (default is <code>nil</code> )

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) | `t`  
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= `:plus-subevents` | `:no-subevents` + | =

The shorthand `+ subevents` specifier is equivalent to `:plus-subevents` and `= to :no-subevents`.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
*atomic-unit-class* |  
(*atomic-unit-class* *subclassing-specifier*) | `t`

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | + | =

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `= to :no-subclasses`.

## See also

**add-event-function** (page [392](#))

**remove-event-function** (page [405](#))

## Examples

Remove all event functions associated with a `instance-created-event` on a `hyp` unit instance:

```
(remove-all-event-functions 'instance-created-event 'hyp)
```

Remove all event functions associated with a `instance-created-event` on a `hyp` unit instance or its subclasses:

```
(remove-all-event-functions 'instance-created-event '(hyp :plus-subclasses))
```

or simply:

```
(remove-all-event-functions 'instance-created-event '(hyp +))
```

## Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

## **remove-all-event-functions**

---

**remove-event-function** *function* [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
&key *slot-names paths permanent*

---

## Purpose

Remove an event function for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*function* A function designator

*event-class-specifier* An extended event-class specification (see below; default is `t`)

*unit-class-or-instance-specifier* An extended unit-class or instance specification (see below; default is `t`)

*slot-names or slot-name* A slot-name or list of slot-names (default is `t`)

*paths or path* A space-instance path regular expression (default is `(*)`)

*permanent* A generalized boolean (default is `nil`)

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) | `t`

*atomic-event-class* ::= *event-class* | *event-class-name*

*subeventing-specifier* ::= `:plus-subevents` | `:no-subevents` + | =

The shorthand `+ subevents` specifier is equivalent to `:plus-subevents` and `=` to `:no-subevents`.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |

*atomic-unit-class* |

(*atomic-unit-class* *subclassing-specifier*) | `t`

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` + | =

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

## See also

**add-event-function** (page [392](#))

**remove-all-event-functions** (page [403](#))

## Examples

Remove the event function **evfn-printv** from the set of functions to be invoked when `instance-created-event` is signaled on a `hyp` unit instance:

```
(remove-event-function 'evfn-printv 'instance-created-event 'hyp)
```

Remove the event function **evfn-printv** from the set of functions to be invoked when `instance-created-event` is signaled on a `hyp` unit instance or its subclasses:

```
(remove-event-function 'evfn-printv 'instance-created-event '(hyp  
:plus-subclasses))
```

or simply:

```
(remove-event-function 'evfn-printv 'instance-created-event '(hyp +))
```

## Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

## **remove-event-function**

---

**resume-event-printing** [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
&key *slot-names paths*

---

## Purpose

Resume the printing of printing-enabled events for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*event-class-specifier* An extended event-class specification (see below; default is  $\top$ )  
*unit-class-or-instance-specifier* An extended unit-class or instance specification (see below; default is  $\top$ )  
*slot-names or slot-name* A slot-name or list of slot-names (default is  $\top$ )  
*paths or path* A space-instance path regular expression (default is  $(*)$ )

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class subeventing-specifier*) |  $\top$   
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= :plus-subevents | :no-subevents + | =

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
*atomic-unit-class* |  
(*atomic-unit-class subclassing-specifier*) |  $\top$

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The *paths* argument is either the symbol  $\top$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**describe-event-printing** (page [396](#))

**disable-event-printing** (page [398](#))

**enable-event-printing** (page [400](#))

**suspend-event-printing** (page [412](#))

## Example

Resume all suspended event printing:

```
(resume-event-printing)
```

## Note

Resuming event printing does not enable event printing that is disabled.

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

## resume-event-printing

---

**signal-event** *event-class* &rest *initargs*

---

[*Function*]

## Purpose

Signal an event.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*event-class* An event class or a non-nil, non-keyword symbol that names an event class

*initargs* An initialization argument list

## Description

The following table lists the initialization arguments that are required for specific event metaclasses:

<b>Event metaclass</b>	<b>Required initargs</b>
non-instance-event-class	None
instance-event-class	:instance <i>unit-instance</i>
space-instance-event-class	:instance <i>unit-instance</i> :space-instance <i>space-instance</i>
nonlink-slot-event-class	:instance <i>unit-instance</i> :slot <i>effective-nonlink-slot-definition</i>
link-slot-event-class	:instance <i>unit-instance</i> :slot <i>effective-link-definition</i>

## See also

```

---

---

**standard-event-class**

---

*[Class]***Package** :gbbopen**Module** :gbbopen-core**Description**

The class **standard-event-class** is the superclass of classes defined by [define-event-class](#). It is a subclass of `standard-class`.

**See also****define-event-class** (page [394](#))**standard-event-instance** (page [411](#))

---

**Package** : gbbopen

**Module** : gbbopen-core

### Description

The class **standard-event-instance** is an instance of **standard-event-class** and is a superclass of every event class that is an instance of **standard-event-class** except itself. It is a subclass of **standard-gbbopen-instance**.

### See also

**print-instance-slots** (page [107](#))

**standard-gbbopen-instance** (page [126](#))

**standard-event-class** (page [410](#))

---

---

**suspend-event-printing** [*event-class-specifier* [*unit-class-or-instance-specifier*]] [*Function*]  
    &key *slot-names paths*

---

## Purpose

Suspend the printing of printing-enabled events for one or more event classes.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*event-class-specifier*           An extended event-class specification (see below; default is  $\tau$ )  
*unit-class-or-instance-specifier* An extended unit-class or instance specification (see below; default is  $\tau$ )  
*slot-names or slot-name*       A slot-name or list of slot-names (default is  $\tau$ )  
*paths or path*                 A space-instance path regular expression (default is  $(*)$ )

## Detailed syntax

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class subeventing-specifier*) |  $\tau$   
*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= :plus-subevents | :no-subevents + | =

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
  *atomic-unit-class* |  
  (*atomic-unit-class subclassing-specifier*) |  $\tau$

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

Suspending event printing is a convenient way of switching off event printing without losing event-printing enabled/disabled settings. Disabled event printing remains disabled if event printing is resumed (by using [resume-event-printing](#)).

The *paths* argument is either the symbol  $\tau$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**describe-event-printing** (page [396](#))

**disable-event-printing** (page [398](#))

**enable-event-printing** (page [400](#))

**resume-event-printing** (page [407](#))

### Example

Suspend all event printing associated with possible-hyp unit instances:

```
(suspend-event-printing 't 'possible-hyp)
```

### Note

Unit-instance-specific event functions are not yet implemented in GBBopen.

---

**suspend-event-printing**

---

**with-events-disabled** (*option*<sup>\*</sup>) *declaration*<sup>\*</sup> *form*<sup>\*</sup>  $\Rightarrow$  *result*<sup>\*</sup>

---

[*Macro*]

## Purpose

Disable event signaling during evaluation of *forms*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*option* No options are currently supported

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**signal-event** (page [409](#))

**with-events-enabled** (page [415](#))

## Example

Create a hyp without signaling any events:

```
> (with-events-disabled ()
   (make-instance 'hyp
                  :location (list x y)
                  :classification '(:car :truck)
                  :color ':red
                  :belief .85
                  :velocity-range '(5 35)
                  :supporting-hyps supporting-hyps))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**with-events-enabled** (*option*<sup>\*</sup>) *declaration*<sup>\*</sup> *form*<sup>\*</sup>  $\Rightarrow$  *result*<sup>\*</sup>

---

[*Macro*]

## Purpose

Restore event signaling during evaluation of *forms*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*option* No options are currently supported

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**signal-event** (page [409](#))

**with-events-disabled** (page [414](#))

## Example

Create a `hyp` without signaling any events, then add supporting-hypothesis links with events enabled:

```
> (with-events-disabled
   (let ((hyp (make-instance 'hyp
                            :location (list x y)
                            :classification '(:car :truck)
                            :color ':red
                            :belief .85
                            :velocity-range '(5 35))))
       (with-events-enabled ()
         (linkf (supporting-hyps-of hyp) supporting-hyps)
         hyp))
   #<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

## 5.3 Intervals

This section contains `:gbbopen-core` entities that pertain to intervals. An interval  $[a, b]$  is the set of real numbers between the start value of the interval,  $a$ , and the end value,  $b$ , inclusive. The interval  $[x, x]$  represents the single point  $x$ .

An interval is represented as either a cons, a two-element list, or a two-element array containing the start and end values of the interval. So, a representation for the interval  $[0, 100]$  can be created as any of the following:

- `(cons 0 100)`
- `(list 0 100)`
- `(vector 0 100)`

The function **make-interval** is provided for stylistic clarity in creating an interval.

Intervals also include the unbounded intervals:

- $(-\infty, \infty)$  (provided as the constant **infinite-interval**)
- $(-\infty, x]$  (for example, **(make-interval x infinity)**)
- $[x, \infty)$  (for example, **(make-interval -infinity x)**)

It is an error for the start value of an interval to be greater than the end value.

---

**\*coerce-contracted-interval-rationals-to-floats\***

[Variable]

---

## Purpose

Control automatic coercion of non-integer rationals to floats when an interval is contracted into a non-integral point range by **expand-interval** and **nexpand-interval**.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A generalized boolean

**Initial value** nil

## See also

**expand-interval** (page [419](#))

**nexpand-interval** (page [426](#))

## Examples

```
> (let ((*coerce-contracted-interval-rationals-to-floats* 't))
    (expand-interval '(2 . 5) -3))
(3.5 . 3.5)
> (let ((*coerce-contracted-interval-rationals-to-floats* nil))
    (expand-interval '(2 . 5) -3))
(7/2 . 7/2)
>
```

---

---

**copy-interval** *interval*  $\Rightarrow$  *new-interval*

[Function]

---

## Purpose

Create a new interval by copying *interval*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*interval* An interval

*new-interval* An interval

## Returns

The new interval.

## Description

The structure of the original *interval* (cons, two-element list, or two-element array) is maintained in the newly allocated *new-interval*.

## See also

**expand-interval** (page [419](#))

**infinite-interval** (page [421](#))

**interval-start** (page [423](#))

**interval-end** (page [422](#))

**make-interval** (page [425](#))

**nexpand-interval** (page [426](#))

**nshift-interval** (page [427](#))

**shift-interval** (page [428](#))

## Examples

```
> (copy-interval '(2 5))
(2 5)
> (copy-interval '(2 . 5))
(2 . 5)
> (expand-interval #(2 5))
#(2 5)
>
```

---

## Purpose

Create a new interval by expanding *interval* by *amount*.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*interval* An interval

*amount* A number

*new-interval* An interval

## Returns

A new, expanded interval.

## Description

The structure of the original *interval* (cons, two-element list, or two-element array) is maintained in the newly allocated, expanded *new-interval*.

An interval that is contracted (expanded negatively) by an amount greater than one-half of its width will result in a zero-width *new-interval* at the center point of the original *interval*.

<b>nshift-interval</b>	(page <a href="#">427</a> )
<b>shift-interval</b>	(page <a href="#">428</a> )

## Examples

```
> (expand-interval '(2 5) 2)
(0 7)
> (expand-interval '(2 . 5) -1)
(3 . 4)
> (expand-interval #(2 5) .5)
#(1.5 5.5)
> (expand-interval '(2 . 5) -3)
(3.5 . 3.5)
>
```

---

**expand-point** *point amount* &optional *type-specifier* ⇒ *new-interval*

---

[Function]

## Purpose

Create a new interval by expanding *point* by *amount*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*point* A number

*amount* A number

*type-specifier* One of: `cons`, `list`, or `array`. (Default is `cons`.)

*new-interval* An interval

## Returns

The new interval.

## See also

**expand-interval** (page [419](#))

**interval-start** (page [423](#))

**interval-end** (page [422](#))

**interval-values** (page [424](#))

**make-interval** (page [425](#))

**nexpand-interval** (page [426](#))

**nshift-interval** (page [427](#))

**shift-interval** (page [428](#))

## Examples

```
> (expand-point 3 2)
(1 . 5)
> (expand-point 3 2 'cons)
(1 . 5)
> (expand-point 3 2 'list)
(1 5)
> (expand-point 3 2 'array)
#(1 5)
>
```

## Note

Declared numeric (see page [143](#)) and pseudo probability (see page [149](#)) versions of **expand-point** are also provided: **expand-point&**, **expand-point\$&**, **expand-point\$**, **expand-point\$\$**, **expand-point\$\$\$**, and **expand-point%**.

---

**Purpose**

An interval (represented as a cons) from `-infinity` to `infinity`.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A cons

**Value** (`-infinity . infinity`)

**See also**

**copy-interval** (page [418](#))

**expand-interval** (page [419](#))

**interval-end** (page [422](#))

**interval-start** (page [423](#))

**interval-values** (page [424](#))

**make-interval** (page [425](#))

**nexpand-interval** (page [426](#))

**nshift-interval** (page [427](#))

**shift-interval** (page [428](#))

**Example**

Define a unit class, `temporal-duration-mixin`, that contains a temporal-duration slot and dimension value declaration:

```
> (define-unit-class temporal-duration-mixin ()
  ((temporal-duration
    ;; Copy the interval to allow destructive changes by
    ;; GBBopen's interval operators:
    :initform (copy-interval infinite-interval)))
  (:dimensional-values
   (temporal-duration :interval temporal-duration)))
#<standard-unit-class temporal-duration-mixin>
>
```

---

**interval-end** *interval*  $\Rightarrow$  *end-value*

---

[*Function*]

## Purpose

Obtain the end value of an interval.

## Self syntax

(setf (interval-end *interval*) *end-value*)  $\Rightarrow$  *end-value*

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*interval* An interval

*end-value* A number

## Returns

The end value of the interval.

## See also

**interval-start** (page [423](#))

**interval-values** (page [424](#))

## Examples

```
> (interval-end '(1 2))
2
> (interval-end '(1 . 2))
2
> (interval-end #(1 2))
2
> (defparameter *x* (make-interval 1 2))
*x*
> *x*
(1 . 2)
> (setf (interval-end *x*) 4)
4
> *x*
(1 . 4)
>
```

---

**interval-start** *interval* ⇒ *start-value*

---

[Function]

## Purpose

Obtain the start value of an interval.

## Self syntax

(setf (interval-start *interval*) *start-value*) ⇒ *start-value*

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*interval* An interval

*start-value* A number

## Returns

The start value of the interval.

## See also

**interval-end** (page [422](#))

**interval-values** (page [424](#))

## Examples

```
> (interval-start '(1 2))
1
> (interval-start '(1 . 2))
1
> (interval-start #(1 2))
1
> (defparameter *x* (make-interval 1 2))
*x*
> *x*
(1 . 2)
> (setf (interval-start *x*) -1)
-1
> *x*
(-1 . 4)
>
```

---

---

**interval-values** *interval*  $\Rightarrow$  *start-value, end-value*

---

[Function]

## Purpose

Obtain the start and end values of an interval.

## Self syntax

(setf (interval-values *interval*) *source-interval*)  $\Rightarrow$  *source-interval*

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*interval*            An interval  
*source-interval*   An interval  
*start-value*        A number  
*end-value*           A number

## Returns

Two values: the start value and the end value of the interval.

## See also

**interval-end** (page [422](#))

**interval-start** (page [423](#))

## Examples

```
> (interval-values '(1 2))
1
2
> (interval-values '(1 . 2))
1
2
> (interval-values #(1 2))
1
2
> (defparameter *** (make-interval 1 2))
***
> ***
(1 . 2)
> (setf (interval-values ***) #(3 4))
#(3 4)
> ***
(3 . 4)
>
```

---

**make-interval** *start end* &optional *type-specifier* ⇒ *new-interval*

---

[Function]

## Purpose

Create a new interval of type *type-specifier*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*start* A number

*end* A number

*type-specifier* One of: `cons`, `list`, or `array`. (Default is `cons`.)

*new-interval* An interval

## Returns

The new interval.

## See also

**copy-interval** (page [418](#))

**expand-interval** (page [419](#))

**expand-point** (page [420](#))

**infinite-interval** (page [421](#))

**interval-start** (page [423](#))

**interval-end** (page [422](#))

**nexpand-interval** (page [426](#))

**nshift-interval** (page [427](#))

**shift-interval** (page [428](#))

## Examples

```
> (make-interval 2 5)
(2 . 5)
> (make-interval 2 5 'list)
(2 5)
> (make-interval 2 5 'cons)
(2 . 5)
> (make-interval 2 5 'array)
#(2 5)
>
```

---

## Purpose

Expand an interval by *amount*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*interval* An interval

*amount* A number

## Returns

The expanded *interval*.

## Description

An interval that is contracted (expanded negatively) by an amount greater than one-half of its width will result in a zero-width *interval* at the center point of the original *interval*.

## See also

<b>*coerce-contracted-interval-rationals-to-floats*</b>	(page <a href="#">417</a> )

<b>nshift-interval</b>	(page <a href="#">427</a> )
<b>shift-interval</b>	(page <a href="#">428</a> )

## Examples

```
> (nexpand-interval '(2 5) 2)
(0 7)
> (nexpand-interval '(2 . 5) -1)
(3 . 4)
> (nexpand-interval #(2 5) .5)
#(1.5 5.5)
> (nexpand-interval '(2 . 5) -3)
(3.5 . 3.5)
>
```

---

**nshift-interval** *interval amount*  $\Rightarrow$  *interval*

---

[Function]

## Purpose

Shift an interval by *amount*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*interval* An interval

*amount* A number

## Returns

The shifted *interval*.

## See also

**make-interval** (page [425](#))

**nexpand-interval** (page [426](#))

**shift-interval** (page [428](#))

## Examples

```
> (nshift-interval '(2 5) 2)
(4 7)
> (nshift-interval '(2 . 5) -1)
(1 . 4)
> (nshift-interval #(2 5) .5)
#(2.5 5.5)
>
```

---

**shift-interval** *interval amount* ⇒ *new-interval*

[*Function*]

---

## Purpose

Create a new interval by shifting *interval* by *amount*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*interval* An interval

*amount* A number

*new-interval* An interval

## Returns

A new, shifted interval.

## Description

The structure of the original *interval* (cons, two-element list, or two-element array) is maintained in the newly allocated, shifted *new-interval*.

## See also

**copy-interval** (page [418](#))

## Examples

```
> (shift-interval '(2 5) 2)
(4 7)
> (shift-interval '(2 . 5) -1)
(1 . 4)
> (shift-interval #(2 5) .5)
#(2.5 5.5)
>
```

## 5.4 Blackboard Repository

This section contains `:gbbopen-core` entities that pertain to space instances and the blackboard repository.

---

**add-instance-to-space-instance** *unit-instance* *space-instance-or-path*  
⇒ *unit-instance*

---

[*Generic Function*]

## Purpose

Add a unit instance to a space instance.

## Method signatures

**add-instance-to-space-instance** (*unit-instance* standard-unit-instance) (*space-instance-path* cons) ⇒ *unit-instance*

**add-instance-to-space-instance** (*unit-instance* standard-unit-instance) (*space-instance* standard-space-instance) ⇒ *unit-instance*

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-instance* The unit instance to be added

*space-instance-or-path* The space instance or space-instance path to which the unit instance is to be added

## Returns

The supplied *unit-instance*

## Events

An `instance-added-to-space-instance-event` is signaled.

## See also

**define-unit-class** (page [330](#))

**make-instance** (page [364](#))

**make-space-instance** (page [455](#))

**remove-instance-from-space-instance** (page [460](#))

## Examples

Add a highly plausible hypothesis unit instance, `good-hyp`, to the `hyps` space instance:

```
> (add-instance-to-space-instance
   good-hyp (find-space-instance-by-path '(bb hyps)))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

or

```
> (add-instance-to-space-instance good-hyp '(bb hyps))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**allowed-unit-classes-of** *space-instance*  
⇒ *extended-unit-classes-specification-list*

---

[*Generic Function*]

## Purpose

Return the extended unit-classes specifications of unit classes whose instances are allowed on a space instance.

## Method signatures

**allowed-unit-classes-of** (*space-instance* *standard-space-instance*) ⇒  
*extended-unit-class-specification-list*

**Package** : *gbbopen*

**Module** : *gbbopen-core*

## Arguments

*space-instance* A space instance

*extended-unit-classes-specification-list* A proper list

## Returns

A list of extended unit-classes specifications; *t*, if instances of any unit class are allowed on the space instance; or *nil*, if no unit instances are allowed on the space instance

## See also

**make-space-instance** (page [455](#))

## Example

Return the extended unit-classes specifications describing the allowed classes that can have their unit instances stored on the `(bb hys)` space instance:

```
> (allowed-unit-classes-of '(bb hys))  
((hyp :plus-subclasses))  
>
```

---

**change-space-instance** *space-instance* &key *allowed-unit-classes* *dimensions* *storage* [Function]  
⇒ *space-instance*

---

## Purpose

Change the dimensions, allowed unit classes, and storage of a space instance.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*space-instance-or-path* The space instance or space-instance path to be changed  
*allowed-unit-classes* An extended unit-classes specification or nil (see below; default is t)  
*dimensions* A list of (*dimension-name* *dimension-type-specifier*) pairs (default is nil)  
*storage* A storage specification (see below; default is (t t unstructured) or nil if *allowed-unit-classes* is nil)  
*space-instance* The space instance

## Returns

The space instance that was changed.

## Events

When the allowed unit classes of *space-instance* are made more restrictive, unit instances that are no longer allowed on the space instance are removed from *space-instance*, signaling a `instance-removed-from-space-instance-event` for each removed unit instance.

## Detailed syntax

*allowed-unit-classes* ::= *unit-classes-specifier* | nil  
*dimension-type-specifier* ::= :ordered | (:ordered [*ordered-comparison-type*]) |  
:enumerated | (:enumerated [*enumerated-comparison-type*]) |  
:boolean | (:boolean [*boolean-comparison-type*])  
*ordered-comparison-type* ::= number | fixnum | short-float | single-float |  
double-float | long-float |  
pseudo-probability  
*enumerated-comparison-type* ::= eq | eql | equal | equalp  
*boolean-comparison-type* ::= t  
*unit-classes-specifier* ::= t | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class* *subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*storage* ::= (*unit-class-specifier* *dimension-names* *storage-specification*) \*  
*dimension-names* ::= *dimension-name* | (*dimension-name*<sup>+</sup>) | t  
*storage-specification* ::= unstructured |  
boolean |  
uniform-buckets :layout *dimension-buckets-specification*<sup>+</sup> |  
hashed [:size *integer*]  
*dimension-buckets-specification* ::= (*start-value* *end-value* *bucket-width*)

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eq1`. The default *boolean-comparison-type* is `t`.

## Terms

*dimension-name* A symbol specifying a dimension

## See also

**make-space-instance** (page [455](#))

## Examples

Change the storage of space instance `(bb hyp)` to the default unstructured storage for all unit instances:

```
> (change-space-instance '(bb hyps) :storage nil)
#<standard-space-instance (bb hyps)>
>
```

Now change it to store `hyp` unit instances with uniform-bucket storage for indexing in the `x` and `y` dimensions and hashed storage in the `classification` dimension:

```
> (change-space-instance '(bb hyps)
  :storage '((hyp :plus-subclasses) (x y)
            uniform-buckets :layout ((0 10000 100)
                                     (0 10000 100)))
      ((hyp :plus-subclasses) (classification)
        hashed))
#<standard-space-instance (bb hyps)>
>
```

Now change it to store only `hyp` unit instances (no subclasses) with uniform-bucket storage for indexing in the `x` and `y` dimensions and hashed storage in the `classification` dimension:

```
> (change-space-instance '(bb hyps)
  :allowed-unit-classes 'hyp
  :storage '((hyp (x y)
                uniform-buckets :layout ((0 10000 100)
                                           (0 10000 100)))
            (hyp (classification) hashed)))
#<standard-space-instance (bb hyps)>
>
```

Any unit instances that are subclasses of `hyp` are removed from the `(bb hyps)` space instance by the above change in allowed unit classes.

---

**Purpose**

Return the child space instances of a space instance.

**Method signatures**

`children-of` (*space-instance* `standard-space-instance`) ⇒ *space-instances*

**Package** : `gbbopen`

**Module** : `gbbopen-core`

**Arguments**

*space-instance* A space instance

*space-instances* A proper list

**Returns**

A list of the child space instances.

**See also**

**make-space-instance** (page [455](#))

**parent-of** (page [459](#))

**Example**

Return the child space instances of the `(bb)` space instance:

```
> (children-of (find-space-instance-by-path ' (bb))
  (#<standard-space-instance (bb hyps)>
   #<standard-space-instance (bb probable-hyps)>
   #<standard-space-instance (bb rejected-hyps)>)
>
```

**Note**

The returned list of child space instances should not be destructively altered.

---

## Purpose

Remove (but not delete) all unit instances from space instances.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*space-instances* A space instance, a list of space instances, a space-instance path regular expression, or `t` (indicating all space instances)

## Events

A `instance-removed-from-space-instance-event` is signaled for each unit instance that is removed from a space instance.

## See also

**do-instances-on-space-instances** (page [472](#))

**map-instances-on-space-instances** (page [493](#))

## Examples

Remove all the unit instances that reside on the `(bb probable-hyps)` space instance:

```
(clear-space-instances
 (find-space-instance-by-path '(bb probable-hyps)))
```

or

```
(clear-space-instances '(bb probable-hyps))
```

or

```
(clear-space-instances
 (find-space-instances '(bb probable-hyps)))
```

---

---

**confirm-if-blackboard-repository-not-empty-p** &key *describe-non-empty-repository* [*Function*]  
*pending-action* ⇒ *boolean*

---

## Purpose

Obtain confirmation if the blackboard repository is not empty.

**Package** : *gbbopen*

**Module** : *gbbopen-core*

## Arguments

*describe-non-empty-repository* A generalized boolean (default is *nil*)

*pending-action* A string (default is "deleted")

*boolean* A generalized boolean

## Returns

True if the blackboard repository is empty or the user has confirmed positively; otherwise *nil*.

## Description

If the blackboard repository is not empty and *describe-non-empty-repository* is true, the blackboard repository is described (using **describe-blackboard-repository**) when asking for confirmation.

The *pending-action* string is used to indicate to the user what is to happen if confirmed positively.

## See also

**empty-blackboard-repository-p** (page [451](#))

## Examples

```
> (confirm-if-blackboard-repository-not-empty-p)
The blackboard repository is not empty.
Continue anyway (the current contents will be deleted) [y or n]? n
nil
> (confirm-if-blackboard-repository-not-empty-p
   describe-non-empty-repository 't)
```

Space Instance	Contents

  (:instance-name-comparison-test instance-name-comparison-test) |
  (:metaclass class-name) |
  (:retain {boolean | :propagate}) |
  (:use-global-instance-name-counter boolean)
initial-space-instance-specifier ::= {space-instance-path+ | function}
dimension-value-specifier ::= incomposite-dv-specifier | composite-dv-specifier
incomposite-dv-specifier ::= (dimension-name dimension-value-spec dimension-value-place)
composite-dv-specifier ::= (dimension-name dimension-value-specifier
  composite-type dimension-value-place)
composite-type ::= :set | :sequence |
  {:ascending-series ordering-dimension-name} |
  {:descending-series ordering-dimension-name}
dimension-value-specifier ::= dimension-value-type |
  (ordered-dimension-value-type [ordered-comparison-type]) |
  (enumerated-dimension-value-type [enumerated-comparison-type]) |
  (boolean-dimension-value-type [boolean-comparison-type])
dimension-value-type ::= ordered-dimension-value-type |
  enumerated-dimension-value-type |
  boolean-dimension-value-type
ordered-dimension-value-type ::= :point | :interval | :mixed
enumerated-dimension-value-type ::= :element
boolean-dimension-value-type ::= :boolean
ordered-comparison-type ::= number | fixnum | short-float | single-float |
  double-float | long-float |
  pseudo-probability
enumerated-comparison-type ::= eq | eql | equal | equalp
boolean-comparison-type ::= t
dimension-value-place ::= {slot-name [slot-name]} | {function [slot-name]}
direct-slots-specifier ::= nil | t | included-slot-name* |
  {t :exclude excluded-slot-name*}

```

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eql`. The default *boolean-comparison-type* is `t`.

A *dimension-value-place* with two *slot-names* is allowed only for an `:interval` dimension-value specification.

## Terms

<i>class-name</i>	A non-nil, non-keyword symbol that names a class
<i>documentation</i>	A documentation string
<i>initarg-list</i>	An initialization argument list
<i>slot-name</i>	A non-nil, non-keyword symbol
<i>instance-name-comparison-test</i>	One of the four standardized hash table test function names: <code>eq</code> , <code>eql</code> , <code>equal</code> , or <code>equalp</code> (default for classes of metaclass <b>standard-unit-class</b> is <code>eql</code> )

## Description

A *dimension-value-place* with two *slot-names* can be specified only for `:interval` dimension-value types.

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class **standard-space-instance**.

The `:metaclass class-name` class option, if specified, must be a subclass of **standard-space-class**. The default metaclass value is **standard-space-class**.

## Inheritance of class options

The set of *dimensional-values* for a unit class is the union of the sets specified in the *dimensional-values* options of the class and its superclasses. When more than one dimension-value specification is supplied for a given dimension, the one supplied by the most specific class is used.

The effective *initial-space-instances* value for a unit class is the value specified in the definition of the most specific unit class. (No additive inheritance of *initial-space-instances* is performed.) If no definitions specify an *initial-space-instances* value, `nil` is used.

The *instance-name-comparison-test* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

If a *retain* value is not specified, a value of `:propagate` is used as the default if any parent unit classes have a `:propagate` retention value; otherwise `nil` is used as the default value.

The *use-global-instance-name-counter* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

## See also

<b>define-unit-class</b>	(page <a href="#">330</a> )
<b>delete-blackboard-repository</b>	(page <a href="#">442</a> )
<b>make-space-instance</b>	(page <a href="#">455</a> )
<b>standard-space-class</b>	(page <a href="#">463</a> )
<b>standard-space-instance</b>	(page <a href="#">464</a> )
<b>with-generate-accessors-format</b>	(page <a href="#">136</a> )

## Example

Define a space class, `space-instance-with-lock`, that has an additional slot containing a lock that can be used to synchronize operations on each space instance of that class. Then, create one instance of the `space-instance-with-lock` space class.

```
> (define-space-class space-with-lock ()
    ((lock :initform (make-lock :name "Space-Instance Lock"))))
#<standard-space-class space-with-lock>
> (make-space-instance '(bb hyps))
```

```
      :class 'space-with-lock)
    #<space-with-lock (bb hys)>
  >
```

## Purpose

Delete all unit and space instances.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*all-classes* A generalized boolean (default is `nil`)

*disable-events* A generalized boolean (default is `t`)

*retain-classes* An extended unit-classes specification (see below)

## Events

If *disable-events* is `nil`, the following events may be signaled as unit instances and space instances are deleted:

- `delete-instance-event`
- `unlink-event`
- `instance-removed-from-space-instance-event`
- `instance-deleted-event`

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class* *subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

## Description

Calling **delete-blackboard-repository** deletes all unit instances and space instances that have not been defined with a `:retain` class option (unless overridden by *all-classes*). All unit instances of unit classes specified by *retain-classes* are also retained. If both *all-classes* and *retain-classes* are specified, the classes specified *retain-classes* are retained, but all other unit instances are deleted. The instance-name counters of all non-retained unit classes are reset to their initial values.

**Delete-blackboard-repository** does not undefine any class definitions, functions, methods, etc.

## See also

**confirm-if-blackboard-repository-not-empty-p** (page [436](#))

**delete-instance** (page [334](#))

**delete-all-space-instances** (page [444](#))

**delete-space-instance** (page [445](#))

**initial-class-instance-number** (page [352](#))

## Examples

Delete all unit instances and space instances (except for the unit instances of unit classes that have been defined to be retained by default):

```
(delete-blackboard-repository)
```

As above, but also delete all unit instances of unit classes that have been defined to be retained by default:

```
(delete-blackboard-repository :all-classes 't)
```

## Note

This function and **reset-gbbopen** are the only GBBopen functions that disable event signaling by default. This conflicts with the normal use of **with-events-disabled** and **with-events-enabled** macros for controlling event signaling, but having events disabled is the desired behavior in almost every `delete-blackboard-repository` situation.

---

**delete-blackboard-repository**

---

**delete-all-space-instances** <no arguments>

[Function]

---

## Purpose

Delete all space instances.

**Package** :gbbopen

**Module** :gbbopen-core

## Events

A `delete-instance-event` is signaled at the start of the deletion process of each space instance and an `instance-deleted-event` is signaled when the deletion of each space instance has been completed. The following events may also be signaled if a *space-instance* is, itself, on a space instance or is linked to other unit instances:

- `unlink-event`
- `instance-removed-from-space-instance-event`

## See also

**delete-all-space-instances** (page [444](#))

**delete-blackboard-repository** (page [442](#))

**delete-space-instance** (page [445](#))

**make-space-instance** (page [455](#))

**reset-gbbopen** (page [461](#))

**reset-unit-class** (page [367](#))

## Example

Delete every space instance:

```
(delete-all-space-instances)
```

---

---

**delete-space-instance** *space-instance-or-path* ⇒ *deleted-space-instance*

---

[*Generic Function*]

## Purpose

Delete a space instance.

## Method signatures

`delete-space-instance` (*space-instance-path* cons) ⇒ *deleted-space-instance*

`delete-space-instance` (*space-instance* standard-space-instance) ⇒ *deleted-space-instance*

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*space-instance-or-path* The space instance or space-instance path to be deleted

*deleted-space-instance* A space instance

## Returns

The deleted space instance.

## Events

A `delete-instance-event` is signaled at the start of the deletion process and an `instance-deleted-event` is signaled when the deletion has been completed. The following events may also be signaled if the *space-instance* is, itself, on a space instance or is linked to other unit instances:

- `unlink-event`
- `instance-removed-from-space-instance-event`

## See also

**delete-all-space-instances** (page [444](#))

**delete-blackboard-repository** (page [442](#))

**delete-instance** (page [334](#))

**make-space-instance** (page [455](#))

**reset-gbbopen** (page [461](#))

**reset-unit-class** (page [367](#))

## Examples

Delete the `(bb hyps)` space instance:

```
> (delete-space-instance (find-space-instance-by-path '(bb hyps)))
#<deleted-unit-instance standard-space-instance (bb hyps)>
>
```

or simply

```
> (delete-space-instance '(bb hyps))
#<deleted-unit-instance standard-space-instance (bb hyps)>
>
```

---

**delete-space-instance**

---

**describe-blackboard-repository** <no arguments>

[Function]

---

## Purpose

Print information about the unit and space instances in the blackboard repository.

**Package** :gbbopen

**Module** :gbbopen-core

## Description

Information is printed about the space instances in the blackboard repository and their contents. The total count of the unit instances of each unit class (including ones that do not reside on any space instance) is also printed, as well as a character that indicates if the unit class has been defined to be *retained* by **delete-blackboard-repository**. A plus sign indicates that the retention status will be propagated to subclasses of the unit class, while an asterisk (\*) indicates a retain, But not propagated, status for the unit class.

The description is printed to the **\*standard-output\*** stream.

## Example

```
> (describe-blackboard-repository)

Space Instance          Contents
-----
bb
  hyps                  15223 Instances (hyp 1479; sensor-report 13744)
  probable-hyps        Empty
  rejected-hyps        216 Instances (hyp 216)

Unit Class              Instances
-----
control-shell          1 *
hyp                    1695
ks                      13 +
ksa                     891 +
ksa-queue              2 +
ordered-ksa-queue      1 +
sensor-report          13744
standard-space-instance 3
-----
                        16350 instances

>
```

## REPL Note

**Describe-blackboard-repository** can be invoked using the REPL command `:dsbb`.

---

---

## Purpose

Describe a space instance.

## Method signatures

`describe-space-instance` (*space-instance-path* cons)

`describe-space-instance` (*space-instance* standard-space-instance)

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*space-instance-or-path* A space instance or a space-instance path

## Description

The description is printed to the **\*standard-output\*** stream.

## See also

**describe-instance** (page [338](#))

**describe-space-instance-storage** (page [449](#))

**make-space-instance** (page [455](#))

## Example

Describe the `hyps` space instance:

```
> (describe-space-instance '(bb hyps))
Standard-space-instance #<standard-space-instance (bb hyps)>
Path: (bb hyps)
Allowed unit classes:
  (hyp :plus-subclasses)
Dimensions:
  (belief (:ordered number))
  (velocity-range (:ordered number))
  (color (:enumerated eq))
  (classification (:enumerated eq))
  (x (:ordered fixnum))
  (y (:ordered fixnum))
>
```

## REPL Note

**Describe-space-instance** can be invoked using the REPL command:

```
:dsi {space-instance | space-instance-path}
```

which also sets = to the described space instance.

---

## Purpose

Describe the storage structure of a space instance.

## Method signatures

`describe-space-instance-storage` (*space-instance-path* cons)

`describe-space-instance-storage` (*space-instance* standard-space-instance)

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*space-instance-or-path* A space instance or a space-instance path

## Description

The description is printed to the **\*standard-output\*** stream.

## See also

**describe-space-instance** (page [448](#))

**describe-instance** (page [338](#))

**make-space-instance** (page [455](#))

## Example

Describe the storage structure of the `hyps` space instance:

```
> (describe-space-instance-storage '(bb hyps))
Standard-space-instance #<standard-space-instance (bb hyps)>
2d-Uniform-Buckets (hyp+) (x y) 1.4 (857/611)
  hyp                479
  sub-hyp            132
Unstructured-Storage (t) t N/A
>
```

## REPL Note

**Describe-space-instance-storage** can be invoked using the REPL command:

```
:dsis {space-instance | space-instance-path}
```

which also sets = to the described space instance.

---

---

**do-space-instances** (*var space-instance-regexp*) {*tag* | *form*}\*

---

[*Macro*]

## Purpose

Iterate over each space instance that matches a path-expression pattern.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

<i>var</i>	A variable symbol
<i>space-instance-regexp</i>	A space-instance path regular expression specifying the space instances to be mapped over
<i>declaration</i>	A declare expression (not evaluated)
<i>tag</i>	A <code>go</code> tag (not evaluated)
<i>form</i>	A form

## Description

The *space-instance-regexp* argument is either the symbol `t` (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

A *space-instance-regexp* value consisting of a list of space instances mapped over as supplied.

## See also

**find-space-instances** (page [453](#))

**map-space-instances** (page [458](#))

## Example

Remove all `hyp` unit instances from space instances that are rooted at `(bb)`:

```
(do-space-instances (space-instance '(bb +))
  (do-instances-on-space-instances (unit-instance 'hyp space-instance)
    (remove-instance-from-space-instance unit-instance space-instance)))
```

---

---

**empty-blackboard-repository-p**  $\Rightarrow$  *boolean*

---

[*Function*]

### Purpose

Determine if the blackboard repository is empty.

**Package** :gbbopen

**Module** :gbbopen-core

### Arguments

*boolean* A generalized boolean

### Returns

True if the blackboard repository is empty; otherwise `nil`.

### See also

**confirm-if-blackboard-repository-not-empty-p** (page [436](#))

### Examples

```
> (empty-blackboard-repository-p)
nil
> (delete-blackboard-repository :all-classes 't)
t
> (empty-blackboard-repository-p)
t
>
```

---

---

**find-space-instance-by-path** *space-instance-path* ⇒ *space-instance* or `nil`

---

[*Function*]

## Purpose

Return the space instance with the specified space-instance path.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*space-instance-path* A space-instance path specifying the space instance to be returned

*space-instance* A space instance or `nil`

## Returns

The specified space instance if it exists; `nil` otherwise.

## See also

**find-space-instances** (page [453](#))

## Example

Find the space instance with path `(bb hys)`:

```
> (find-space-instance-by-path '(bb hys))
#<standard-space-instance (bb hys)>
>
```

## REPL Note

**find-space-instance-by-path** can be invoked using the REPL command:

```
:fsi {space-instance | space-instance-path}
```

which sets = to the found space instance.

---

## Purpose

Return the space instances that match a path-expression pattern.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*space-instance-regexp* A space-instance path regular expression specifying the space instances to be returned

*space-instances* A proper list

## Returns

The specified space instances.

## Description

The *space-instance-regexp* argument is either the symbol `t` (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path Thus both
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

(`find-space-instances ' (*)`) and (`find-space-instances ' t`) return all space instances.

A *space-instance-regexp* value consisting of a list of space instances is returned unchanged.

## See also

**find-space-instance-by-path** (page [452](#))

**map-space-instances** (page [458](#))

## Examples

Return the space instances that are rooted at `(bb)`:

```
> (find-space-instances '(bb +))
(#<standard-space-instance (bb hyps)>
 #<standard-space-instance (bb probable-hyps)>
 #<standard-space-instance (bb rejected-hyps)>)
>
```

Return all the space instances `(bb)` and below:

```
> (find-space-instances '(bb *))
(#<standard-space-instance (bb hyps)>
 #<standard-space-instance (bb probable-hyps)>
 #<standard-space-instance (bb rejected-hyps)>
 #<standard-space-instance (bb)>)
>
```

---

**find-space-instances**

---

**make-space-instance** *path* &rest *initargs* &key *allowed-unit-classes* *dimensions* [Function]  
*storage* *make-parents* *class*  
⇒ *space-instance*

---

## Purpose

Create a new space instance.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*path* A space-instance path specifying the location in the blackboard repository where the new space instance is to be created

*initargs* An initialization argument list

*allowed-unit-classes* An extended unit-classes specification or nil (see below; default is t)

*dimensions* A list of (*dimension-name* *dimension-type-specifier*) pairs (default is nil)

*storage* A storage specification (see below; default is (t t unstructured) or nil if *allowed-unit-classes* is nil)

*make-parents* A generalized boolean (default is nil)

*class* The name of the space class for the created space instance (default is standard-space-instance)

*space-instance* A space instance

## Returns

The created space instance.

## Events

When a space instance is created, events are signaled in the following sequence:

1. An `nonlink-slot-updated-event` or `link-event` is signaled for each slot in the newly created space instance. A `link-event` is also signaled for each inverse pointer from an existing space instance or unit instance to the newly created space instance.
2. An `instance-added-to-space-instance-event` is signaled for each space instance on which the newly created space instance is added.
3. A `instance-created-event` is signaled.

## Errors

Use of an initialization argument that has not been declared as valid.

The supplied or generated instance name is identical to the instance name of an existing unit instance of *class*.

## Detailed syntax

*allowed-unit-classes* ::= *unit-classes-specifier* | nil

*dimension-type-specifier* ::= :ordered | (:ordered [*ordered-comparison-type*]) |  
:enumerated | (:enumerated [*enumerated-comparison-type*]) |  
:boolean | (:boolean [*boolean-comparison-type*])

```

ordered-comparison-type ::= number | fixnum | short-float | single-float |
                             double-float | long-float |
                             pseudo-probability
enumerated-comparison-type ::= eq | eql | equal | equalp
boolean-comparison-type ::= t

unit-classes-specifier ::= t | single-unit-class-specifier | (single-unit-class-specifier+)
single-unit-class-specifier ::= atomic-unit-class | (atomic-unit-class subclassing-specifier)
atomic-unit-class ::= unit-class | unit-class-name

storage ::= (unit-class-specifier dimension-names storage-specification) *
dimension-names ::= dimension-name | (dimension-name+) | t
storage-specification ::= unstructured |
                           boolean |
                           uniform-buckets :layout dimension-buckets-specification+ |
                           hashed[:size integer]

dimension-buckets-specification ::= (start-value end-value bucket-width)

```

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eql`. The default *boolean-comparison-type* is `t`.

## Terms

*dimension-name* A symbol specifying a dimension

## Description

Specifying a `:space-instances` initialization argument causes that value to be used instead of any `:initial-space-instances` specification associated with the space class. However, note that placing a space instance on other space instances is unrelated to the layout of blackboard repository hierarchy, which is specified by the `:paths` initialization argument. Placing a space instance on other space instances is no different from placing any other unit instance on a space instance.

## See also

<b>allowed-unit-classes-of</b>	(page <a href="#">431</a> )
<b>change-space-instance</b>	(page <a href="#">432</a> )

<b>define-space-class</b>	(page <a href="#">438</a> )
<b>delete-all-space-instances</b>	(page <a href="#">444</a> )
<b>delete-space-instance</b>	(page <a href="#">445</a> )
<b>describe-instance</b>	(page <a href="#">338</a> )
<b>describe-space-instance</b>	(page <a href="#">448</a> )
<b>describe-space-instance-storage</b>	(page <a href="#">449</a> )
<b>dimensions-of</b>	(page <a href="#">344</a> )
<b>make-instance</b>	(page <a href="#">364</a> )
<b>parent-of</b>	(page <a href="#">459</a> )

## Examples

Create a top-level space instance, `bb`, that cannot store any unit instances:

```

> (make-space-instance ' (bb)
   :allowed-unit-classes nil)
#<standard-space-instance (bb)>

```

&gt;

Now create a space instance for `hyp` unit instances, named `hyps`, as a child of `bb`, with uniform, 100-wide, bucket storage for indexing unit instances with dimension values between 0–10,000 in the `x` and `y` dimensions:

```
> (make-space-instance '(bb hyps)
  :dimensions (dimensions-of 'hyp)
  :allowed-unit-classes '((hyp :plus-subclasses))
  :storage '((hyp :plus-subclasses) (x y)
            uniform-buckets :layout ((0 10000 100)
                                     (0 10000 100))))
#<standard-space-instance (bb hyps)>
>
```

Here is an improved space instance for `hyp` unit instances named `hyps`, with both uniform-bucket storage for indexing in the `x` and `y` dimensions and hashed storage to retrieve match candidates via classification dimension values:

```
> (make-space-instance '(bb hyps)
  :dimensions (dimensions-of 'hyp)
  :allowed-unit-classes '((hyp :plus-subclasses))
  :storage '((hyp :plus-subclasses) (x y)
            uniform-buckets :layout ((0 10000 100)
                                     (0 10000 100)))
            ((hyp :plus-subclasses) (classification)
            hashed)))
#<standard-space-instance (bb hyps)>
>
```

## Note

The **make-space-instance** function is equivalent to using **make-instance** with the desired space class and with the initialization argument `:instance-name` containing the space-instance path. However, using **make-space-instance** provides a convenient shorthand and is preferable stylistically.

---

**make-space-instance**

## Purpose

Apply a function once to each space instance that matches a path-expression pattern.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*function* A function designator specifying a function object of one argument  
*space-instance-regexp* A space-instance path regular expression specifying the space instances to be mapped over

## Description

The *space-instance-regexp* argument is either the symbol  $\dagger$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

A *space-instance-regexp* value consisting of a list of space instances mapped over as supplied.

## See also

**do-space-instances** (page [450](#))

**find-space-instances** (page [453](#))

## Example

Remove all *hyp* unit instances from space instances that are rooted at (*bb*):

```
(map-space-instances
  #'(lambda (space-instance)
      (map-instances-on-space-instances
        #'(lambda (unit-instance)
            (remove-instance-from-space-instance unit-instance
space-instance))
          'hyp
space-instance))
  '(bb +))
```

## Purpose

Return the parent space instance of a space instance.

## Method signatures

**parent-of** (*space-instance* standard-space-instance) ⇒ *space-instance*

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*space-instance* A space instance

*space-instances* A proper list

## Returns

The parent space instance or `nil`, if *space-instance* does not have a parent.

## See also

**children-of** (page [434](#))

**make-space-instance** (page [455](#))

## Examples

Return the parent space instance of the `(bb hyp)` space instance:

```
> (parent-of (find-space-instance-by-path ' (bb hyp) )
#<standard-space-instance (bb)>
>
```

Return the parent space instance (there is none) of the `(bb)` space instance:

```
> (parent-of (find-space-instance-by-path ' (bb) )
nil
>
```

## Purpose

Remove a unit instance from a space instance.

## Method signatures

```
remove-instance-from-space-instance (unit-instance
                                     standard-unit-instance) (space-instance-path cons)
remove-instance-from-space-instance (unit-instance standard-unit-instance) (space-instance
                                     standard-space-instance)
```

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-instance* The unit instance to be removed

*space-instance-or-path* The space instance or space-instance path from which the unit instance is to be removed

## Events

A `instance-removed-from-space-instance-event` is signaled.

## See also

**add-instance-to-space-instance** (page [430](#))

## Examples

Remove an incorrect hypothesis unit instance, `incorrect-hyp`, from the `hyps` space instance:

```
> (remove-instance-from-space-instance
   incorrect-hyp (find-space-instance-by-path '(bb hyps)))
#<hyp 311 (896 388) 0.68 [0..6]>
>
```

or

```
> (remove-instance-from-space-instance incorrect-hyp '(bb hyps))
#<hyp 311 (896 388) 0.68 [0..6]>
>
```

---

## Purpose

Unconditionally delete all unit and space instances, remove all event functions, and disable event printing.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*disable-events*            A generalized boolean (default is `t`)

## Events

If *disable-events* is `nil`, the following events may be signaled (in order) as unit instances and space instances are deleted:

- `delete-instance-event`
- `unlink-event`
- `instance-removed-from-space-instance-event`
- `instance-deleted-event`

## Description

Calling **reset-gbbopen** deletes all unit instances and space instances, disables all event printing, removes all event functions, and resets all unit-class instance-name counters to their initial values. **Reset-gbbopen** does not undefine any class definitions, functions, methods, etc.

## See also

<b>confirm-if-blackboard-repository-not-empty-p</b>	(page <a href="#">436</a> )
<b>delete-all-space-instances</b>	(page <a href="#">444</a> )
<b>delete-instance</b>	(page <a href="#">334</a> )
<b>delete-space-instance</b>	(page <a href="#">445</a> )
<b>define-ks-class</b>	(page <a href="#">591</a> )
<b>define-ksa-class</b>	(page <a href="#">595</a> )
<b>define-space-class</b>	(page <a href="#">438</a> )
<b>define-unit-class</b>	(page <a href="#">330</a> )
<b>initial-class-instance-number</b>	(page <a href="#">352</a> )
<b>reset-gbbopen</b>	(page <a href="#">461</a> )
<b>reset-unit-class</b>	(page <a href="#">367</a> )

## Example

Prepare for a new application by resetting GBBopen:

```
> (reset-gbbopen)
t
>
```

**Note**

This function and **delete-blackboard-repository** are the only GBBopen functions that disable event signaling by default. This conflicts with the normal use of **with-events-disabled** and **with-events-enabled** macros for controlling event signaling, but having events disabled is the desired behavior in almost every reset situation.

---

**reset-gbbopen**

---

**standard-space-class***[Space Class]*

---

**Package** : gbbopen**Module** : gbbopen-core**Description**

The class **standard-space-class** is the default class of space classes defined by [define-space-class](#). It is a subclass of [standard-unit-class](#).

**See also****standard-space-instance** (page [464](#))**standard-unit-class** (page [369](#))

---

**Package** :gbbopen

**Module** :gbbopen-core

### Description

The class **standard-space-instance** is the default class of instances created by [make-space-instance](#). A space instance is also a unit instance, so **standard-space-instance** is a subclass of [standard-unit-instance](#).

### See also

[deleted-unit-instance](#) (page [337](#))

[print-instance-slots](#) (page [107](#))

[standard-space-class](#) (page [463](#))

[standard-unit-instance](#) (page [370](#))

---

---

**with-blackboard-repository-locked** (&key *whostate*) *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

After locking the blackboard repository, execute forms and then release the lock.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*whostate* A string (default "With Blackboard Repository Locked")

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**thread-whostate** (page [259](#))

## Example

Lock the blackboard repository and do some stuff:

```
(with-blackboard-repository-locked ()  
  (do-some-stuff))
```

## Note

The *whostate* value is ignored by [SBCL](#).

---

## 5.5 Instance Retrieval

This section contains `:gbbopen-core` entities that pertain to unit-instance retrieval and unit-instance iteration and mapping.

---

**\*find-verbose\***

[*Variable*]

---

### Purpose

Controls the printing of retrieval and matching information by **do-instances-on-space-instances**, **filter-instances**, **find-instances**, and **map-instances-on-space-instances** when the keyword argument `:verbose` has not been specified.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A generalized boolean

**Initial value** nil

### See also

**do-instances-on-space-instances** (page [472](#))

**filter-instances** (page [476](#))

**find-instances** (page [483](#))

**map-instances-on-space-instances** (page [493](#))

---

---

**\*use-marking\***

[Variable]

---

## Purpose

Controls the use of instance marking versus ESETs for retrieval and matching by **do-instances-on-space-instances**, **find-instances**, and **map-instances-on-space-instances** when the keyword argument `:use-marking` has not been specified.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A generalized boolean

**Initial value** `t`

## See also

**do-instances-on-space-instances** (page [472](#))

**filter-instances** (page [476](#))

**find-instances** (page [483](#))

**map-instances-on-space-instances** (page [493](#))

---

---

**\*warn-about-unusual-requests\***

[Variable]

---

## Purpose

Control warning messages of “unusual” **do-instances-on-space-instances**, **find-instances**, and **map-instances-on-space-instances** requests that are likely to be mistakes.

**Package** :gbbopen

**Module** :gbbopen-core

**Value type** A generalized boolean

**Initial value** True

## See also

**do-instances-on-space-instances** (page [472](#))

**filter-instances** (page [476](#))

**find-instances** (page [483](#))

**map-instances-on-space-instances** (page [493](#))

## Example

Suppress the warning message associated with an unachievable retrieval pattern:

```
> (filter-instances nil '(and (> x 3) (< x 2)))
;; Warning: Pattern (and (> X 3) (< X 2)) can not be satisfied.
nil
> (let ((*warn-about-unusual-requests* nil))

---

**do-instances-of-class** (*var unit-classes-specifier*) *declaration*\* {*tag* | *form*}\*

---

[*Macro*]

## Purpose

Iterate over all unit instances of the specified unit classes.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*var* A variable symbol  
*unit-classes-specifier* An extended unit-classes specification (see below)  
*declaration* A declare expression (not evaluated)  
*tag* A go tag (not evaluated)  
*form* A form

## Detailed syntax

*unit-classes-specifier* ::=  $\tau$  | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The iteration over the unit instances of the specified unit classes is performed once for each unit instance, whether or not the instances reside on any space instances.

## See also

**class-instances-count** (page [329](#))  
**clear-space-instances** (page [435](#))  
**do-instances-on-space-instances** (page [472](#))  
**find-instances-of-class** (page [488](#))  
**make-instances-of-class-vector** (page [490](#))  
**map-instances-of-class** (page [491](#))  
**map-instances-on-space-instances** (page [493](#))  
**map-sorted-instances-of-class** (page [496](#))

## Examples

Delete all unit instances of the unit class hyp:

```
(do-instances-of-class (instance 'hyp)
  (delete-instance instance))
```

Delete all unit instances of the unit class hyp and instances of subclasses of hyp:

```
(do-instances-of-class (instance ' (hyp :plus-subclasses))
  (delete-instance instance))
```

or simply:

```
(do-instances-of-class (instance ' (hyp +))
  (delete-instance instance))
```

### Note

The consequences are unspecified if an attempt is made to add or delete a unit instance while **do-instances-of-class** is in progress. There is one exception to this restriction: the current unit instance in the iteration (bound to *var*) can be deleted, provided that the deletion does not trigger the deletion of any other unit instances. For example, the following form intended to delete all space instances violates this restriction:

```
(do-instances-of-class (space-instance
  ' (standard-space-instance :plus-subclasses))
  (delete-space-instance space-instance))
```

because deletion of a space instance with children automatically deletes those child space instances. The function **delete-all-space-instances** provides an efficient means of deleting all space instances without violating this rule.

### REPL Note

The equivalent of `(do-instances-of-class (instance arg) (print instance))` can be invoked using the REPL command `:pic [arg]`. If *arg* is omitted, `t` is assumed.

---

**do-instances-of-class**

---

**do-instances-on-space-instances** (*var unit-classes-specifier space-instances &key pattern [Macro] filter-before filter-after use-marking verbose*)  
{tag | form}<sup>\*</sup>

---

## Purpose

Iterate over each unit instance on space instances, optionally selected by a retrieval pattern.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

<i>var</i>	A variable symbol
<i>unit-classes-specifier</i>	An extended unit-classes specification (see below)
<i>space-instances</i>	A space instance, a list of space instances, a space-instance path regular expression, or <code>t</code> (indicating all space instances)
<i>pattern</i>	A retrieval pattern (see below; default is <code>t</code> )
<i>filter-before</i>	A single-argument predicate to be applied before pattern-matching tests occur
<i>filter-after</i>	A single-argument predicate to be applied after pattern-matching tests occur
<i>use-marking</i>	A generalized boolean (default is <b>*use-marking*</b> )
<i>verbose</i>	A generalized boolean (default is <b>*find-verbose*</b> )
<i>declaration</i>	A declare expression (not evaluated)
<i>tag</i>	A <code>go</code> tag (not evaluated)
<i>form</i>	A form

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

                                             abuts$$ | starts$$ | ends$$
ordered-dimension-long-float-pattern-op ::= <$$$ | <=$$$ | >=$$$ | >$$$ | =$$$ | /= $$$ |
                                             within$$$ | covers$$$ | overlaps$$$ |
                                             abuts$$$ | starts$$$ | ends$$$
ordered-dimension-pseudo-probability-pattern-op ::= <% | <=% | >=% | >% | =% | /=% |
                                                    within% | covers% | overlaps% |
                                                    abuts% | starts% | ends%
enumerated-dimension-pattern-op ::= is | enumerated-dimension-explicit-test-pattern-op
enumerated-dimension-explicit-test-pattern-op ::= is-eq | is-eql | is-equal | is-equalp
boolean-dimension-binary-pattern-op ::= eqv
boolean-dimension-unary-pattern-op ::= true | false
dimension-names ::= dimension-name | (dimension-name+)
pattern-values ::= pattern-value |
                (pattern-value+) |
                (pattern-value+ . pattern-value) |
                # (pattern-value+)
pattern-value ::= point | interval | element | set
interval ::= (start end) | (start . end) | # (start end)

```

## Terms

*point*    A number, infinity, or -infinity  
*start*    A number or -infinity  
*end*      A number or infinity  
*element* An object

## Description

The iteration is performed only once for each selected unit instance, even if the unit instance resides on multiple space instances.

The *pattern*  $\tau$  matches all unit instances whose dimension values overlap the dimensional extent of at least one space instance in *space-instances*. The *pattern* `:all` matches every unit instance on a

space instance in *space-instances*, regardless of dimensional overlap.

Declared numeric (see page 143) and pseudo probability (see page 149) pattern operators are also supported, for example: `=&`, `=$&`, `=$`, `=$$`, `=$$$`, and `=%` and `within&`, `within$&`, `within$`, `within$$`, `within$$$`, and `within%`.

## See also

**\*find-verbose\*** (page 467)

**find-instances** (page 483)  
**find-instances-of-class** (page 488)  
**make-instances-of-class-vector** (page 490)  
**map-instances-of-class** (page 491)  
**map-instances-on-space-instances** (page 493)  
**with-find-stats** (page 498)  
 Declared numerics (page 143)

## Examples

Remove all the `hyp` unit instances that reside on the `(bb probable-hyps)` space instance, deleting those unit instances that do not reside on any other space instance:

```
(let ((space-instance
      (find-space-instance-by-path '(bb probable-hyps))))
  (do-instances-on-space-instances (instance 'hyp space-instance)
    (if (>= (length (space-instances-of instance) 1)
        (remove-instance-from-space-instance
         instance space-instance)
        (delete-instance instance))))
```

Delete `hyp` unit instances that reside on the `(bb probable-hyps)` space instance that have a belief value less than 0.5:

```
(do-instances-on-space-instances (instance 'hyp '(bb probable-hyps)
                                         :pattern '< belief .5)
  (delete-instance instance))
```

## Note

Fixnum overlaps comparisons can result in bignum computations if the combined intervals of the pattern and a candidate unit instance exceeds `most-positive-fixnum`.

---

## do-instances-on-space-instances

---

**do-sorted-instances-of-class** (*var unit-classes-specifier predicate &key key*) {*tag | form*}\* [*Macro*]

---

## Purpose

Iterate over each unit instance of the specified unit classes, in sorted order.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

<i>var</i>	A variable symbol
<i>unit-classes-specifier</i>	An extended unit-classes specification (see below)
<i>predicate</i>	A function designator specifying a function object of two arguments that returns a generalized boolean
<i>key</i>	A function designator specifying a function object of one argument, or <code>nil</code> (default is <code>nil</code> )
<i>declaration</i>	A declare expression (not evaluated)
<i>tag</i>	A <code>go</code> tag (not evaluated)
<i>form</i>	A form

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `= to :no-subclasses`.

## Description

The iteration is performed once for each unit instance of the specified unit classes, whether or not the instances reside on any space instances.

## See also

**do-instances-of-class** (page [470](#))

**map-instances-on-space-instances** (page [493](#))  
**map-sorted-instances-of-class** (page [496](#))

## Example

Print a list of all `hyp` instance names, in ascending order:

```
(do-sorted-instances-of-class (instance 'hyp #'< :key #'instance-name-of)
  (print (instance-name-of instance)))
```

---

**filter-instances** *unit-instances pattern* &key *filter-before filter-after verbose*  
⇒ *matching-unit-instances*

---

[Function]

## Purpose

Select matching unit instances from a list of unit instances based on a retrieval pattern.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-instances* A list of unit instances  
*pattern* A retrieval pattern (see below)  
*filter-before* A single-argument predicate to be applied before pattern-matching tests occur  
*filter-after* A single-argument predicate to be applied after pattern-matching tests occur  
*verbose* A generalized boolean (default is **\*find-verbose\***)  
*matching-unit-instances* A proper list of unit instances

## Returns

A newly consed list of unit instances that satisfy the specified pattern and predicate filters.

## Detailed syntax

```

Declared numerics (page 143)

## Examples

```
> (filter-instances (supporting-hyps-of hyp) '(> belief .8))
(#<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (filter-instances (supporting-hyps-of hyp) `(within belief (.85
,infinity)))
(#<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
>
```

## Note

Fixnum overlaps comparisons can result in bignum computations if the combined intervals of the pattern and a candidate unit instance exceeds `most-positive-fixnum`.

---

## filter-instances

---

**find-all-instances-by-name** *instance-name* &optional *unit-class-specifier* [Function]  
⇒ *unit-instances*

---

## Purpose

Retrieve unit instances with a given *name*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*instance-name*            The instance name for the retrieval  
*unit-class-specifier*    An extended unit-class specification (see below; default is `t`)  
*unit-instances*           A proper list of unit instances

## Returns

A list of the unit instances with the specified *name* of the specified *classes* if any exist; `nil` otherwise.

## Detailed syntax

*unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class* *subclassing-specifier*) | `t`  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `= to` `:no-subclasses`.

## Description

The `:instance-name-comparison-test` function (`eq`, `eql`, `equal`, or `equalp`) specified in **define-unit-class** is used to match *instance-name* with the unit-instance's instance name. If you are using strings as the names of unit instances, you should specify `equal` (case sensitive) or `equalp` (case insensitive) as the comparison function in the unit classes of those unit instances.

## See also

**define-unit-class**            (page [330](#))  
**filter-instances**            (page [476](#))  
**find-all-instances-by-name** (page [479](#))  
**find-instance-by-name**        (page [481](#))  
**find-instances**              (page [483](#))

## Examples

Find all unit instances (of any unit class) that are named 419:

```
> (find-instances-by-name 419 't)
(#<hyp 419 (1835 4791) 0.85 [5..35]>)
>
```

Find all unit instances (of any unit class) that are named 419:

```
> (find-instances-by-name 419 '(hyp :plus-subclasses))
(#<hyp 419 (1835 4791) 0.85 [5..35]>)
>
```

or simply:

```
> (find-instances-by-name 419 '(hyp +))  
(#<hyp 419 (1835 4791) 0.85 [5..35]>)  
>
```

---

**find-all-instances-by-name**

---

**find-instance-by-name** *instance-name* &optional *unit-class-specifier* *errorp* [Function]  
⇒ *unit-instance*

---

## Purpose

Retrieve a unit instance by its instance name.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*instance-name*      The instance name for the retrieval  
*unit-class-specifier*    An extended unit-class specification (see below; default is `t`)  
*errorp*                A generalized boolean (default is `nil`)  
*unit-instance*        A unit instance or `nil`

## Returns

The first unit instance found of the specified *class(es)* that has the specified *instance-name* if one exists; `nil` otherwise.

## Errors

If *errorp* is true, an error is signaled if no unit instance is found.

## Detailed syntax

*unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*) | `t`  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

## Description

The `:instance-name-comparison-test` function (`eq`, `eql`, `equal`, or `equalp`) specified in **define-unit-class** is used to match *instance-name* with the unit-instance's instance name. When strings are used as the names of unit instances, `equal` (case sensitive) or `equalp` (case insensitive) should be specified as the comparison function in the unit classes of those unit instances.

## See also

**filter-instances**                (page [476](#))  
**find-instances**                 (page [483](#))  
**find-all-instances-by-name** (page [479](#))

## Example

Find the `hyp` unit instance 419:

```
> (find-instance-by-name 419 'hyp)
#<hyp 419 (1835 4791) 0.85 [5..35]>
> (find-instance-by-name 0 'hyp)
nil
```

```
> (find-instance-by-name 0 'hyp 't)
No unit instance named 0 of class hyp was found.
>
```

### REPL Note

**Find-instance-by-name** can be invoked using the REPL command:

```
:fi instance-name [unit-classes-specifier [errorp]]
```

which sets = to the found unit instance.

---

### find-instance-by-name

---

**find-instances** *unit-classes-specifier space-instances pattern* [Function]  
&key *filter-before filter-after use-marking verbose* ⇒ *unit-instances*

---

## Purpose

Retrieve unit instances from space instances based on a retrieval pattern.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-classes-specifier* An extended unit-classes specification (see below)

*space-instances* A space instance, a list of space instances, a space-instance path regular expression, or `t` (indicating all space instances)

*pattern* A retrieval pattern (see below)

*filter-before* A single-argument predicate to be applied before pattern-matching tests occur

*filter-after* A single-argument predicate to be applied after pattern-matching tests occur

*use-marking* A generalized boolean (default is **\*use-marking\***)

*verbose* A generalized boolean (default is **\*find-verbose\***)

*unit-instances* A proper list of unit instances

## Returns

A newly consed list of unit instances specified by *unit-class-specifier* that reside on *space-instances* and satisfy the specified *pattern* and any predicate filters.

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

*pattern* ::= *subpattern* | `t` | `:all`

*subpattern* ::= *pattern-element* |  
(`not` *subpattern*) |  
(`and` *subpattern*<sup>\*</sup>) |  
(`or` *subpattern*<sup>\*</sup>)

*pattern-element* ::= (*pattern-op dimension-names pattern-values option*<sup>\*</sup>) |  
(*boolean-dimension-unary-pattern-op dimension-names option*<sup>\*</sup>)

*pattern-op* ::= *ordered-dimension-pattern-op* |  
*enumerated-dimension-pattern-op* |  
*boolean-dimension-binary-pattern-op*

*ordered-dimension-pattern-op* ::= *ordered-dimension-any-numeric-value-pattern-op* |  
*ordered-dimension-explicit-type-pattern-op*

```

ordered-dimension-explicit-type-pattern-op ::= ordered-dimension-fixnum-pattern-op |
                                              ordered-dimension-short-float-pattern-op |
                                              ordered-dimension-single-float-pattern-op |
                                              ordered-dimension-double-float-pattern-op |
                                              ordered-dimension-long-float-pattern-op |
                                              ordered-dimension-pseudo-probability-pattern-op
ordered-dimension-any-numeric-value-pattern-op ::= < | <= | >= | > | = | /= |
                                                  within | covers | overlaps |
                                                  abuts | starts | ends
ordered-dimension-fixnum-pattern-op ::= <& | <=& | >=& | >& | =& | /=& |

                                         abuts& | starts& | ends&
ordered-dimension-short-float-pattern-op ::= <$& | <=$& | >=$& | >$& | =$& | /=& |
                                             within$& | covers$& | overlaps$& |
                                             abuts$& | starts$& | ends$&
ordered-dimension-single-float-pattern-op ::= <$ | <=$ | >=$ | >$ | =$ | /= $ |
                                             within$ | covers$ | overlaps$ |
                                             abuts$ | starts$ | ends$
ordered-dimension-double-float-pattern-op ::= <$$ | <=$$ | >=$$ | >$$ | =$ $ | /= $ $ |
                                             within$$ | covers$$ | overlaps$$ |
                                             abuts$$ | starts$$ | ends$$
ordered-dimension-long-float-pattern-op ::= <$$$ | <=$$$ | >=$$$ | >$$$ | =$ $ $ | /= $ $ $ |
                                             within$$$ | covers$$$ | overlaps$$$ |
                                             abuts$$$ | starts$$$ | ends$$$
ordered-dimension-pseudo-probability-pattern-op ::= <% | <=% | >=% | >% | =% | /=% |
                                                    within% | covers% | overlaps% |
                                                    abuts% | starts% | ends%
enumerated-dimension-pattern-op ::= is | enumerated-dimension-explicit-test-pattern-op
enumerated-dimension-explicit-test-pattern-op ::= is-eq | is-eql | is-equal | is-equalp
boolean-dimension-binary-pattern-op ::= eqv
boolean-dimension-unary-pattern-op ::= true | false
dimension-names ::= dimension-name | (dimension-name+)
pattern-values ::= pattern-value |
                (pattern-value+) |
                (pattern-value+ . pattern-value) |
                #(pattern-value+)
pattern-value ::= point | interval | element | set
interval ::= (start end) | (start . end) | #(start end)

```

## Terms

*point*     A number, infinity, or -infinity  
*start*     A number or -infinity  
*end*        A number or infinity  
*element*   An object

## Description

The *pattern* *t* matches all unit instances whose dimension values overlap the dimensional extent of at least one space instance in *space-instances*. The *pattern* *:all* matches every unit instance on a space instance in *space-instances*, regardless of dimensional overlap. Use of **find-instances** with a *t* or *:all* *pattern* in production code often indicates a missed opportunity to use a more efficient **do-instances-of-class**, **do-instances-on-space-instances**, or **do-sorted-instances-of-class**

approach (or their `map-` variants).

Declared numeric (see page 143) and pseudo probability (see page 149) pattern operators are also supported, for example: `=&`, `=$&`, `=$`, `=$$`, `=$$$`, and `=%` and `within&`, `within$&`, `within$`, `within$$`, `within$$$`, and `within%`.

## Examples

Here are some basic examples of finding hyp unit instances:

```
> (find-instances 'hyp (find-space-instance-by-path '(bb hyps))
  '(and (= x 1835) (> belief .8)))
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 335 (1835 8419) 0.92 [15..35]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (find-instances 'hyp '(bb hyps)
  `(and (= x 1835)
        (> belief ,(belief-of (find-instance-by-name 331 'hyp)))))
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 335 (1835 8419) 0.92 [15..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>)
> (find-instances '(hyp :no-subclasses) '(bb hyps)
  '(=& (x y) (1835 8419)))
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 335 (1835 8419) 0.92 [15..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (within belief (.85 .9))))
(#<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
```

```

> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (overlaps velocity-range (0 10))))
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (overlaps velocity-range (35 40))))
(#<hyp 335 (1835 8419) 0.92 [15..35]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (covers velocity-range (0 10))))
(#<hyp 183 (1835 4791) 0.82 [0..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (covers velocity-range (4 10))))
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (within velocity-range (0 10))))
nil
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (within velocity-range (0 20))))
(#<hyp 319 (1835 8419) 0.91 [4..12]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (starts velocity-range 5)))
(#<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (ends velocity-range 30)))
(#<hyp 331 (1835 8419) 0.88 [15..30]>)
> (find-instances 'hyp '(bb hyps)
  '(and (= x 1835) (abuts velocity-range (5 30))))
(#<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
> (find-instances 'hyp '(bb hyps)
  '(is color :silver))
(#<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 231 (1488 7405) 0.63 [0..8]>)
> (find-instances 'hyp '(bb hyps)
  '(is-eq color :yellow))
(#<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 311 (896 388) 0.68 [0..6]>)
>

```

#### Some examples finding a word unit instance:

```

> (find-instances 'word '(words) '(is character #\s))
(#<word 1>)

```

```
> (find-instances 'word '(words) '(is character #\x))
nil
>
```

**Find word unit instances with special characters in them:**

```
> (find-instances 'word '(words) '(overlaps char-code (0 64)))
(#<word 1>)
>
```

## Note

Fixnum overlaps comparisons can result in bignum computations if the combined intervals of the pattern and a candidate unit instance exceeds most-positive-fixnum.

---

**find-instances**

## Purpose

Return a list of all unit instances of the specified unit classes.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

*unit-classes-specifier* An extended unit-classes specification (see below)

*unit-instances* A proper list of unit instances

## Returns

A newly consed list of all unit instances of the unit classes specified by *unit-class-specifier*, whether or not they reside on any space instance.

## Detailed syntax

*unit-classes-specifier* ::= t | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## See also

**class-instances-count** (page [329](#))

**do-instances-of-class** (page [470](#))

**map-instances-of-class** (page [491](#))

**map-instances-on-space-instances** (page [493](#))

**map-sorted-instances-of-class** (page [496](#))

## Example

Return the list of all hyp unit instances:

```
> (find-instances-of-class 'hyp)
(#<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>
 #<hyp 231 (1488 7405) 0.63 [0..8]>
 #<hyp 311 (896 388) 0.68 [0..6]>
 ...
 #<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 335 (1835 8419) 0.92 [15..35]>)
>
```

## Note

In general, **do-instances-of-class** or **map-instances-of-class** is preferred over operating on the list created by **find-instances-of-class**.

---

**find-instances-of-class**

---

**Purpose**

Return a (newly allocated) vector containing the unit instances of the specified unit classes.

**Package** :gbbopen

**Module** :gbbopen-core

**Arguments**

*adjustable* A generalized boolean (default is `nil`)

*vector* A vector (optionally adjustable) with a fill pointer

**Returns**

The vector containing the unit instances.

**Detailed syntax**

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

**See also**

**do-instances-of-class** (page [470](#))

**find-instances-of-class** (page [488](#))

**map-instances-of-class** (page [491](#))

**map-sorted-instances-of-class** (page [496](#))

**Example**

Create a vector containing all unit instances of the unit class `hyp` and subclasses of `hyp`:

```
(make-instances-of-class-vector ' (hyp :plus-subclasses))
```

or simply:

```
(make-instances-of-class-vector ' (hyp +))
```

## Purpose

Apply a function once to each unit instance of the specified unit classes.

**Package** : `gbbopen`

**Module** : `gbbopen-core`

## Arguments

*function* A function designator specifying a function object of one argument

*unit-classes-specifier* An extended unit-classes specification (see below)

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+ subclasses` specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

## Description

The specified function is applied once to each unit instance of the specified unit classes, whether or not the instances reside on any space instances.

## See also

**class-instances-count** (page [329](#))

**clear-space-instances** (page [435](#))

**do-instances-of-class** (page [470](#))

**find-instances-of-class** (page [488](#))

**make-instances-of-class-vector** (page [490](#))

**map-instances-on-space-instances** (page [493](#))

**map-sorted-instances-of-class** (page [496](#))

## Examples

Delete all unit instances of the unit class `hyp`:

```
(map-instances-of-class #'delete-instance 'hyp)
```

Delete all unit instances of the unit class `hyp` and instances of subclasses of `hyp`:

```
(map-instances-of-class #'delete-instance '(hyp :plus-subclasses))
```

or simply:

```
(map-instances-of-class #'delete-instance '(hyp +))
```

## Note

The consequences are unspecified if an attempt is made to add or delete a unit instance while **map-instances-of-class** is in progress. There is one exception to this restriction: *function* may delete its unit instance argument, provided that deletion does not trigger the deletion of any other unit instances. For example, the following form intended to delete all space instances violates this restriction:

```
(map-instances-of-class
 #'delete-space-instance
 '(standard-space-instance :plus-subclasses))
```

because deletion of a space instance with children automatically deletes those child space instances. The function **delete-all-space-instances** provides an efficient means of deleting all space instances without violating this rule.

## REPL Note

The equivalent of `(map-instances-of-class 'print arg)` can be invoked using the REPL command

```
:pic [unit-classes-specifier]
```

If *arg* is omitted, `t` is used as the default.

---

## map-instances-of-class

---

**map-instances-on-space-instances** *function unit-classes-specifier space-instances* [Function]  
 &key *pattern filter-before filter-after use-marking*  
*verbose*

---

## Purpose

Apply a function once to each unit instance on space instances, optionally selected by a retrieval pattern.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*function* A function designator specifying a function object of one argument  
*unit-classes-specifier* An extended unit-classes specification (see below)  
*space-instances* A space instance, a list of space instances, a space-instance path regular expression, or  $\top$  (indicating all space instances)  
*pattern* A retrieval pattern (see below; default is  $\top$ )  
*filter-before* A single-argument predicate to be applied before pattern-matching tests occur  
*filter-after* A single-argument predicate to be applied after pattern-matching tests occur  
*use-marking* A generalized boolean (default is **\*use-marking\***)  
*verbose* A generalized boolean (default is **\*find-verbose\***)

## Detailed syntax

*unit-classes-specifier* ::=  $\top$  | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

*pattern* ::= *subpattern* |  $\top$  | :all  
*subpattern* ::= *pattern-element* |  
           (not *subpattern*) |

pattern-values ::= pattern-value |
                (pattern-value+) |
                (pattern-value+ . pattern-value) |
                # (pattern-value+)
pattern-value ::= point | interval | element | set
interval ::= (start end) | (start . end) | # (start end)

```

## Terms

*point* A number, infinity, or -infinity  
*start* A number or -infinity  
*end* A number or infinity  
*element* An object

## Description

The *function* will be applied only once to each unit instance, even if the unit instance resides on multiple space instances.

The *pattern*  $\dagger$  matches all unit instances whose dimension values overlap the dimensional extent of at least one space instance in *space-instances*. The *pattern* `:all` matches every unit instance on a space instance in *space-instances*, regardless of dimensional overlap.

Declared numeric (see page 143) and pseudo probability (see page 149) pattern operators are also supported, for example: `=&`, `=$&`, `=$`, `=$$`, `=$$$`, and `=%` and `within&`, `within$&`, `within$`, `within$$`, `within$$$`, and `within%`.

<b>map-instances-of-class</b>	(page 491)
<b>map-sorted-instances-of-class</b>	(page 496)
<b>with-find-stats</b>	(page 498)
Declared numerics	(page 143)

## Examples

Remove all the `hyp` unit instances that reside on the `(bb probable-hyps)` space instance, deleting those unit instances that do not reside on any other space instance:

```
(let ((space-instance
      (find-space-instance-by-path '(bb probable-hyps))))
  (map-instances-on-space-instances
   #'(lambda (instance)
        (if (>= (length (space-instances-of instance) 1))
            (remove-instance-from-space-instance instance
              space-instance)
            (delete-instance instance)))
      'hyp
      space-instance))
```

Delete `hyp` unit instances that reside on the `(bb probable-hyps)` space instance that have a belief value less than 0.5:

```
(map-instances-on-space-instances
 #'delete-instance
 'hyp '(bb probable-hyps) :pattern '(< belief .5))
```

## Note

`Fixnum overlaps` comparisons can result in bignum computations if the combined intervals of the pattern and a candidate unit instance exceeds `most-positive-fixnum`.

---

**map-sorted-instances-of-class** *function unit-classes-specifier predicate &key key* [Function]

---

## Purpose

Apply a function once to each unit instance of the specified unit classes, in sorted order.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*function* A function designator specifying a function object of one argument  
*unit-classes-specifier* An extended unit-classes specification (see below)  
*predicate* A function designator specifying a function object of two arguments that returns a generalized boolean  
*key* A function designator specifying a function object of one argument, or nil (default is nil)

## Detailed syntax

*unit-classes-specifier* ::=  $\tau$  | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)  
*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)  
*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The specified function is applied once to each unit instance of the specified unit classes, whether or not the instances reside on any space instances.

## See also

**do-sorted-instances-of-class** (page [475](#))

**make-instances-of-class-vector** (page [490](#))

**map-instances-of-class** (page [491](#))

## Example

Print a list of all hyp instance names, in ascending order:

```
(map-sorted-instances-of-class
 #'(lambda (instance)
      (print (instance-name-of instance)))
 'hyp #'< :key #'instance-name-of)
```

## Purpose

Display the retrieval statistics collected for **find-instances** and **map-instances-on-space-instances**.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*reset* A generalized boolean (default is nil)

## Description

**Report-find-stats** displays the retrieval statistics within the scope of an active **with-find-stats**.

If *reset* is non-nil, the statistics are cleared after the report is displayed.

## See also

**with-find-stats** (page [498](#))

## Examples

```
> (with-find-stats ()
  (scanner (find-instance-by-name 471 'hyp))
  (report-find-stats)
  (scanner (find-instance-by-name 632 'hyp)))
;; Find/Map Statistics:
;;   20 find/map operations (0 using marking, 20 using hashing)
;;   100 buckets scanned
;;   9240 instances touched
;;   9240 instances considered
;;   521 instances accepted
;;   0.16 seconds (0.80 msec/operation)
;; Find/Map Statistics:
;;   40 find/map operations (0 using marking, 40 using hashing)
;;   200 buckets scanned
;;   18480 instances touched
;;   18480 instances considered
;;   1042 instances accepted
;;   0.32 seconds (0.80 msec/operation)
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>)
> (report-find-stats)
;; No find/map statistics are available.
>
```

---

**with-find-stats** (&key *initialize report*) *declaration*\* *form*\*  $\Rightarrow$  *result*\*

---

[*Macro*]

## Purpose

Record and optionally display retrieval statistics for **find-instances** and **map-instances-on-space-instances**.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*initialize* A generalized boolean(default is `t`)

*report* A generalized boolean(default is `t`)

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**find-instances** (page [483](#))

**map-instances-on-space-instances** (page [493](#))

**report-find-stats** (page [497](#))

**without-find-stats** (page [499](#))

## Example

Collect and display the retrieval statistics associated with running an application function `scanner`:

```
> (with-find-stats ()
   (scanner (find-instance-by-name 471 'hyp)))
;; Find/Map Statistics:
;;      20 find/map operations (0 using marking, 20 using hashing)
;;      100 buckets scanned
;;      9240 instances touched
;;      9240 instances considered
;;      521 instances accepted
;;      0.16 seconds (0.80 msec/operation)
(#<hyp 419 (1835 4791) 0.85 [5..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>)
>
```

---

**without-find-stats** *declaration*\* *form*\* ⇒ *result*\*

[*Macro*]

---

## Purpose

Disable the collecting of retrieval statistics while executing *forms*.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**with-find-stats** (page [498](#))

## Example

Collect and display the retrieval statistics associated with running an application function scanner:

```
> (with-find-stats ()
   (scanner (find-instance-by-name 471 'hyp))
   (without-find-stats
    (scanner (find-instance-by-name 632 'hyp))))
;; Find/Map Statistics:
;;      20 find/map operations (0 using marking, 20 using hashing)
;;      100 buckets scanned
;;      9240 instances touched
;;      9240 instances considered
;;      521 instances accepted
;;      0.16 seconds (0.80 msec/operation)
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>)
>
```

---

## 5.6 Saving and Sending

This section contains :gbbopen-core entities that pertain to saving/sending and loading/reading objects.

---

**\*block-saved/sent-time\***

[*Variable*]

---

### **Purpose**

Dynamically bound in **with-reading-saved/sent-objects-block** to the Universal Time when the block was saved/sent.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Initial value** Unbound

### **See also**

**\*block-saved/sent-value\*** (page [502](#))

**with-reading-saved/sent-objects-block** (page [516](#))

**with-saving/sending-block** (page [518](#))

---

---

**\*block-saved/sent-value\***

[*Variable*]

---

### **Purpose**

Dynamically bound in **with-reading-saved/sent-objects-block** to the saved/sent value associated with the block.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Initial value** Unbound

### **See also**

**\*block-saved/sent-time\*** (page [501](#))

**with-reading-saved/sent-objects-block** (page [516](#))

**with-saving/sending-block** (page [518](#))

---

---

**\*print-object-for-sending\***

[Variable]

---

## Purpose

Controls **print-object-for-saving/sending** printing customization for sending versus for saving.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A generalized boolean

**Initial value** nil

## See also

**omitted-slots-for-saving/sending** (page [510](#))

**print-object-for-saving/sending** (page [511](#))

**print-slot-for-saving/sending** (page [513](#))

## Example

Send some hyp unit instances to another agent:

```
> (let ((*print-object-for-sending* 't)
      (with-saving/sending-block (stream :package ':my-app)
        (let ((*save/send-references-only* nil)
            (do-instances-of-class (instance 'hyp :plus-subclasses)
              (print-object-for-saving/sending instance stream))))))
  nil
>
```

---

**\*save/send-references-only\***

[Variable]

---

## Purpose

Controls whether **print-object-for-saving/sending** prints references to instances or the instance contents.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

**Value type** A generalized boolean

**Initial value** True

## See also

**omitted-slots-for-saving/sending** (page [510](#))

**print-object-for-saving/sending** (page [511](#))

**print-slot-for-saving/sending** (page [513](#))

## Example

Send some `hyp` unit instances to another agent:

```
> (let ((*print-object-for-sending* 't)
      (with-saving/sending-block (stream :package ':my-app)
        (let ((*save/send-references-only* nil)
          (do-instances-of-class (instance 'hyp :plus-subclasses)
            (print-object-for-saving/sending instance stream))))))
  nil
>
```

---

**initialize-saved/sent-instance** *instance slots slot-values missing-slot-names* [Generic Function]  
⇒ *instance*

---

## Purpose

Initializes the slots of *instance* when reading saved (or sent) values.

## Method signatures

initialize-saved/sent-instance (*instance* standard-object) *slots slot-values missing-slot-names* ⇒  
*instance*

initialize-saved/sent-instance (*instance* standard-unit-instance) *slots slot-values*  
*missing-slot-names* ⇒ *instance*

initialize-saved/sent-instance (*instance* standard-space-instance) *slots slot-values*  
*missing-slot-names* ⇒ *instance*

**Package** :gbbopen-tools

**Module** :gbbopen-tools (the unit-instance and space-instance methods are added by  
:gbbopen-core)

## Arguments

*instance* A standard-object instance

*slots* A list of effective-slot-definition objects

*slot-values* A list of values (corresponding to the slots in *slots*)

*missing-slot-names* A list of symbols naming slots and slot values that were saved/sent, but which  
are no longer present in the class definition of *instance*.

## Returns

The *instance*.

## Description

**Initialize-saved/sent-instance** is called when loading a blackboard repository or journal or when  
reading a network-streamer connection; it should not be called directly.

## See also

**load-blackboard-repository** (page [507](#))

**with-reading-saved/sent-objects-block** (page [516](#))

## Examples

Restore the binary value of slot `song` in unit instances of `bird` that was saved/sent as a Base64  
portable string (see the companion encoding example on page [513](#)):

```
(defmethod initialize-saved/sent-instance :after ((bird bird)
                                                slots slot-values
                                                missing-slot-names)
  (declare (ignore slots slot-values missing-slot-names))
  (setf (song-of bird) (base64-decode (song-of bird))))
```

Transfer the slot value that was saved/sent as the slot named `old-slot` to the slot named `new-slot`  
in the current class definition of `hyp`:

```
(defmethod initialize-saved/sent-instance :after ((hyp hyp)
                                                slots slot-values
                                                missing-slot-names)
  (declare (ignore missing-slot-names))
  (let ((position (position 'old-slot slots
                          :key #'slot-definition-name
                          :test #'eq)))
    (setf (new-slot-of hyp) (nth position slot-values))))
```

---

**initialize-saved/sent-instance**

---

**load-blackboard-repository** *pathname* &key *class-name-translations* *coalesce-strings* [Function]  
*confirm-if-not-empty* *disable-events*  
*estimated-peak-forward-references* *external-format*  
*readtable* *read-eval* *retain-classes* *retain-event-functions*  
*retain-event-printing*  
⇒ *pathname*, *saved-time*, *saved-value*

---

## Purpose

Load the blackboard repository (all unit instances and space instances) that has been saved to a file previously by **save-blackboard-repository**.

**Package** : gbbopen

**Module** : gbbopen-core

## Arguments

<i>pathname</i>	A pathname designator
<i>class-name-translations</i>	An association list (default is <code>nil</code> )
<i>coalesce-strings</i>	A generalized boolean (default is <code>nil</code> )
<i>confirm-if-not-empty</i>	A generalized boolean (default is <code>true</code> )
<i>disable-events</i>	A generalized boolean (default is <code>t</code> )
<i>estimated-peak-forward-references</i>	An integer (default is <code>*default-estimated-peak-forward-references*</code> )
<i>external-format</i>	An external-file-format designator (default is <code>:default</code> )
<i>readtable</i>	A readtable (default is <code>*reading-saved/sent-objects-readtable*</code> )
<i>read-eval</i>	A generalized boolean (default is <code>nil</code> )
<i>retain-classes</i>	An extended unit-classes specification (see below)
<i>retain-event-functions</i>	A generalized boolean (default is <code>nil</code> )
<i>retain-event-printing</i>	A generalized boolean (default is <code>nil</code> )
<i>pathname</i>	A pathname
<i>saved-time</i>	A Universal Time
<i>saved-value</i>	An object

## Returns

Three values: the pathname of the saved blackboard-repository data file, the time when the blackboard-repository data file was saved, and the save value specified when the repository was saved. If replacing a non-empty blackboard repository is not confirmed, `nil` is returned.

## Events

If *disable-events* is `nil`, the following events may be signaled (in order) as unit instances and space instances are deleted prior to loading:

- `delete-instance-event`
- `unlink-event`
- `instance-removed-from-space-instance-event`
- `instance-deleted-event`

## Description

If *pathname* does not specify a file type, the type `bb` is added to it. Then, `(user-homedir-pathname)` is used to supply any missing components to *pathname*.

The *class-name-translations* association list, if specified, should contain conses of the form:

```
(class-name . new-class-name)
```

for any class translations that should occur during repository loading.

If *coalesce-strings* is true, loaded strings that are `equal` become shared (`eq`). This coalescing is performed using a temporary hash table whose initial size can be specified by providing an integer value for *coalesce-strings*. If a hash table is provided as the value for *coalesce-strings*, it is used in place of the temporary hash table.

If *confirm-if-not-empty* is true, the user must confirm loading when the current blackboard repository contains unit instances.

Unit instances that are referenced before they are defined are recorded using a temporary hash table whose initial size can be specified by providing an integer value for *estimated-peak-forward-references*.

## See also

**confirm-if-blackboard-repository-not-empty-p** (page [436](#))

**save-blackboard-repository** (page [514](#))

**with-reading-saved/sent-objects-block** (page [516](#))

## Examples

Load the GBBopen Tutorial Example application (without running it) and then load a blackboard repository that was saved previously:

```
> :tutorial-example :noautorun
...
> (load-blackboard-repository "tutorial")
;; 35 temporarily forward-referenced instances (peak count)
#P"<homedir>/tutorial.bb"
3429178245
#<path 1>
>
```

Try loading the repository again:

```
> (load-blackboard-repository "tutorial")
The blackboard repository is not empty.
Continue anyway (the current contents will be deleted) [y or n]? n
nil
>
```

Define a new unit class, *new-location*, and then load the repository again, translating all *location* unit instances to *new-location* unit instances:

```
> (define-unit-class new-location (location) ())
#<standard-unit-class new-location>
> (load-blackboard-repository "tutorial"
  :class-name-translations '((location . new-location))
  :confirm-if-not-empty nil)
;; 35 temporarily forward-referenced instances (peak count)
```

```
#P"<homedir>/tutorial.bb"  
3429178245  
#<path 1>  
> :dsbb
```

Space Instance	Contents
-----	-----
known-world	54 instances (53 new-location; 1 path)

Unit Class	Instances
-----	-----
control-shell	1 *
ks	4 +
ksa-queue	2 +
new-location	53
ordered-ksa-queue	1 +
path	1
standard-space-instance	1
	-----
	63 instances

>

---

**omitted-slots-for-saving/sending** *instance* ⇒ *omitted-slot-names*

---

[*Generic Function*]

## Purpose

Add slot names of a class to the list of slots that are not saved or sent.

## Method signatures

`omitted-slots-for-saving/sending` (*instance* `standard-space-instance`) ⇒ *omitted-slot-names*

`omitted-slots-for-saving/sending` (*instance* `standard-unit-instance`) ⇒ *omitted-slot-names*

`omitted-slots-for-saving/sending` (*instance* `t`) ⇒ `nil`

**Package** : `gbbopen-tools`

**Module** : `gbbopen-tools` (the `unit-instance` and `space-instance` methods are added by `:gbbopen-core`)

## Arguments

*instance* An instance

*omitted-slot-names* A proper list

## Returns

A list of omitted slot names for the class of *instance*.

## See also

**\*print-object-for-sending\*** (page [503](#))

**load-blackboard-repository** (page [507](#))

**print-object-for-saving/sending** (page [511](#))

**print-slot-for-saving/sending** (page [513](#))

**save-blackboard-repository** (page [514](#))

## Example

Specify that slot `complex-unsaved-slot` in `my-unit-instance` should be added to the list of slots that are not saved or sent:

```
(defmethod omitted-slots-for-saving/sending ((instance my-unit-instance))
  (cons 'complex-unsaved-slot (call-next-method)))
```

---

## Purpose

Write the printed representation of *object* to *stream* when saving or sending.

## Method signatures

`print-object-for-saving/sending` (*object* array) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* bit-vector) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* cons) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* function) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* generic-function) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* hash-table) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* package) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* standard-class) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* standard-generic-function) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* standard-object) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* standard-unit-instance) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* string) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* structure-object) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* vector) *stream* ⇒ *object*  
`print-object-for-saving/sending` (*object* t) *stream* ⇒ *object*

**Package** :gbbopen-tools

**Module** :gbbopen-tools (the unit-instance method is added by :gbbopen-core)

## Arguments

*object* An object

*stream* A stream

## Returns

The *object*.

## Errors

A call to **print-object-for-saving/sending** was made outside the dynamic scope of a **with-saving/sending-block**.

## See also

**\*print-object-for-sending\*** (page [503](#))  
**omitted-slots-for-saving/sending** (page [510](#))  
**print-slot-for-saving/sending** (page [513](#))  
**save-blackboard-repository** (page [514](#))  
**with-saving/sending-block** (page [518](#))

**Example**

Define a method to save/send compiled-function references, when possible:

```
(defmethod print-object-for-saving/sending ((fn function)
                                           stream)

  (flet ((save/send-error ()
         (let ((*print-readably* nil))
           (error "Unable to save/send ~s reliably." fn))))
    (typecase fn
      (compiled-function
       (multiple-value-bind (lambda-expression closure-p name)
         (function-lambda-expression fn)
         (declare (ignore lambda-expression)
                  #+(or cmu sbcl)
                  (ignore closure-p))
         (when (or
                ;; CMUCL and SBCL always return that
                ;; closure-p is true, so we ignore their
                ;; closure-p value and risk that 'fn' might
                ;; be a non-trivial closure that can't be
                ;; represented externally:
                #-(or cmu sbcl)
                closure-p
                ;; Implementations are free to always return
                ;; nil as name or return an object that is
                ;; not valid for use as a name in function.
                ;; Fortunately, implementations usually
                ;; provide a useful name value:
                (not (symbolp name))
                (not name))
              (save/send-error)
              (format stream "#'~s" name)))
         (otherwise (save/send-error))))
      fn)
```

Note that the above method is not without risk, but it will work in many situations.

---

**print-object-for-saving/sending**

---

## Purpose

Write the printed representation of slot *slot-name* in *object* to *stream* when saving or sending.

## Method signatures

**print-slot-for-saving/sending** (*instance* standard-object) *slot-name stream*

**print-slot-for-saving/sending** (*instance* standard-unit-instance) (*slot-name* (eql gbbopen::%%space-instances%%)) *stream*

**Package** :gbbopen-tools

**Module** :gbbopen-tools (the unit-instance method is added by :gbbopen-core)

## Arguments

*instance* A standard-object instance

*slot-name* A non-nil, non-keyword symbol

*stream* A stream

## Errors

A call to **print-slot-for-saving/sending** was made outside the dynamic scope of a **with-saving/sending-block**.

## See also

**\*print-object-for-sending\*** (page [503](#))

**omitted-slots-for-saving/sending** (page [510](#))

**print-object-for-saving/sending** (page [511](#))

**print-slot-for-saving/sending** (page [513](#))

**save-blackboard-repository** (page [514](#))

## Example

Write the binary value of slot `song` in unit instances of `bird` as a Base64 portable string (see the companion decoding example on page [505](#)):

```
(defmethod print-slot-for-saving/sending ((bird bird) (slot-name (eql
'song)) stream)
  (print-object-for-saving/sending (base64-encode (song-of bird)) stream))
```

---

**save-blackboard-repository** *pathname* &key *external-format* *package* [Function]  
*read-default-float-format* *value*  
⇒ *saved-repository-pathname*

---

## Purpose

Save the blackboard repository (all unit instances and space instances) to a file.

**Package** :gbbopen

**Module** :gbbopen-core

## Arguments

*pathname* A pathname designator  
*external-format* An external-file-format designator (default is :default)  
*package* A package designator indicating the package to be used when saving and loading the blackboard repository (default is :common-lisp)  
*read-default-float-format* One of the atomic type specifiers *short-float*, *single-float*, *double-float*, or *long-float* to be used when saving and loading the blackboard repository (default is *single-float*)  
*value* An object to be saved with the repository and returned when the repository is loaded (default is *nil*)  
*saved-repository-pathname* A pathname

## Returns

The pathname of the saved blackboard-repository data file.

## Description

If *pathname* does not specify a file type, the type *bb* is added to it. Then, *(user-homedir-pathname)* is used to supply any missing components to *pathname*.

The size of the blackboard-repository data file can be reduced by specifying a *package* containing the majority of the symbols that are written to the file.

A **with-saving/sending-block**, with the *package* and *read-default-float-format* values, is established when saving the blackboard repository.

## See also

**load-blackboard-repository** (page 507)  
**omitted-slots-for-saving/sending** (page 510)  
**print-object-for-saving/sending** (page 511)  
**print-slot-for-saving/sending** (page 513)  
**with-saving/sending-block** (page 518)

## Example

Run the GBBopen Tutorial Example application and then save the resulting blackboard repository:

```
> :tutorial-example
...
;; No executable KSAs remain, exiting control shell
```

```
;; Control shell 1 exited: 63 cycles completed
;; Run time: 0.04 seconds
;; Elapsed time: 0 seconds
:quiescence
> (save-blackboard-repository "tutorial" :package ' :tutorial)
#P"<homedir>/tutorial.bb"
>
```

Save the repository again, this time with a value to be returned when the repository is loaded:

```
> (save-blackboard-repository "tutorial"
  :package ' :tutorial
  :value (find-instance-by-name 1 'path))
#P"<homedir>/tutorial.bb"
>
```

---

**save-blackboard-repository**

---

**with-reading-saved/sent-objects-block** (*stream* &key *class-name-translations* [Macro]  
*coalesce-strings*  
*estimated-peak-forward-references* *readtable*  
*read-eval*) *form*\*  $\Rightarrow$  *result*\*

---

## Purpose

Bind reader and GBBopen reading-saved/sent-objects control variables) to values that produce standard GBBopen reading-saved/sent-objects behavior when evaluating *forms*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>stream</i>	A stream
<i>class-name-translations</i>	An association list (default is <code>nil</code> )
<i>coalesce-strings</i>	A generalized boolean (default is <code>nil</code> )
<i>estimated-peak-forward-references</i>	An integer (default is <code>*default-estimated-peak-forward-references*</code> )
<i>readtable</i>	A readtable (default is <code>*reading-saved/sent-objects-readtable*</code> )
<i>read-eval</i>	A generalized boolean (default is <code>nil</code> )
<i>forms</i>	An implicit <b>progn</b> of forms to be evaluated
<i>results</i>	The values returned by evaluating the last <i>form</i>

## Returns

The values returned by evaluating the last *form*.

## Description

Within the dynamic extent of the body of *forms*, all Common Lisp reader control variables (including any implementation-defined ones) and GBBopen reading-saved/sent-objects control variables are bound to values that produce standard GBBopen reading-saved/sent-objects behavior. The function **load-blackboard-repository** establishes a **with-reading-saved/sent-objects-block** when loading the blackboard repository, and this macro can be used in constructing specialized reading-saved/sent-objects operations.

The *class-name-translations* association list, if specified, should contain conses of the form:

`(class-name . new-class-name)`

for any class translations that should occur during reading.

If *coalesce-strings* is true, strings read within the dynamic extent of the body of *forms* that are equal become shared (`eq`). This coalescing is performed using a temporary hash-table whose initial size can be specified by providing an integer value for *coalesce-strings*. If a hash table is provided as the value for *coalesce-strings*, it is used in place of the temporary hash table.

Unit instances that are referenced before they are defined are recorded using a temporary hash table whose initial size can be specified by providing an integer value for *estimated-peak-forward-references*.

---

**with-reading-saved/sent-objects-block**

---

**with-saving/sending-block** (*stream* &key *package read-default-float-format value*) [Macro]  
*form*\* ⇒ *result*\*

---

## Purpose

Bind printer and GBBopen save/send control variables) to values that produce standard GBBopen save/send-object behavior when evaluating *forms*.

**Package** :gbbopen-tools

**Module** :gbbopen-tools

## Arguments

<i>stream</i>	A stream
<i>package</i>	A package designator indicating the package to be used when saving/sending and when loading/receiving (default is :common-lisp)
<i>read-default-float-format</i>	One of the atomic type specifiers <code>short-float</code> , <code>single-float</code> , <code>double-float</code> , or <code>long-float</code> (default is <code>single-float</code> )
<i>value</i>	An object to be saved/sent and bound to <b>*block-saved/sent-value*</b> when loading/receiving with <b>with-reading-saved/sent-objects-block</b> (default is <code>nil</code> )
<i>forms</i>	An implicit <b>progn</b> of forms to be evaluated
<i>results</i>	The values returned by evaluating the last <i>form</i>

## Returns

The values returned by evaluating the last *form*.

## Description

Within the dynamic extent of the body of *forms*, all Common Lisp printer control variables (including any implementation-defined ones) and GBBopen save/send control variables are bound to values that produce standard GBBopen save/send-object behavior. The function **save-blackboard-repository** establishes a **with-saving/sending-block** when saving the blackboard repository, and this macro can be used in constructing specialized saving/sending operations.

## 5.7 Queue Management

The `:queue` module provides queue-management objects and operators.

---

**clear-queue** *queue*

[*Generic Function*]

---

## Purpose

Quickly remove all elements from queue.

## Method signatures

`clear-queue` (*queue* `queue`)

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*queue* A GBBopen queue

## See also

**insert-on-queue** (page [523](#))

**make-queue** (page [525](#))

**remove-from-queue** (page [535](#))

## Example

Remove all pending KSAs that have been triggered but not yet executed:

```
(clear-queue pending-ksas)
```

---

---

**do-queue** (*var queue*) *declaration*\* {*tag* | *form*}\*

---

[*Macro*]

## Purpose

Iterate over each queue element on the specified *queue*.

**Package** :gbbopen

**Module** :queue

## Arguments

*var* A variable symbol

*queue* A GBBopen queue

*declaration* A declare expression (not evaluated)

*tag* A go tag (not evaluated)

*form* A form

## Description

The iteration over queue elements is performed in queue order (first to last).

## See also

**map-queue** (page [526](#))

**queue** (page [532](#))

**ordered-queue** (page [530](#))

## Example

Count the number of pending KSAs that were triggered by hyp:

```
> (let ((count 0))
    (do-queue (ksa pending-ksas)
      (when (memq hyp (collect-trigger-instances ksa))
        (incf& count)))
    count)
31
>
```

---

**first-queue-element** *queue* ⇒ *queue-element*

[*Generic Function*]

---

## Purpose

Return the first queue element on *queue*.

## Method signatures

`first-queue-element (queue queue) ⇒ queue-element`

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*queue* A GBBopen queue

*queue-element* A GBBopen queue element object

## Returns

The first queue element on *queue*.

## See also

**last-queue-element** (page [524](#))

**nth-queue-element** (page [528](#))

## Example

```
> (first-queue-element pending-ksas)
#<ksa 2217>
>
```

---

**insert-on-queue** *queue-element queue* ⇒ *queue-element*

---

[*Generic Function*]

## Purpose

Insert a queue element on *queue*.

## Method signatures

`insert-on-queue` (*queue-element* *queue-element*) (*queue* *queue*) ⇒ *queue-element*

`insert-on-queue` (*queue-element* *queue-element*) (*queue* *ordered-queue*) ⇒ *queue-element*

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*queue-element* A GBBopen queue element object

*queue* A GBBopen queue

## Returns

The supplied *queue-element*.

## Description

If *queue* is an ordered queue, the position of *queue-element* in *queue* is based on the key and test functions provided when the queue was created. If *queue* is a standard queue, *queue-element* is inserted at the end of the queue.

## See also

**clear-queue** (page [520](#))

**make-queue** (page [525](#))

**remove-from-queue** (page [535](#))

## Example

```
> (insert-on-queue ksa pending-ksas)
#<ksa 2372>
>
```

---

---

**last-queue-element** *queue* ⇒ *queue-element*

[*Generic Function*]

---

## Purpose

Return the last queue element on *queue*.

## Method signatures

last-queue-element (*queue* *queue*) ⇒ *queue-element*

**Package** : gbbopen

**Module** : queue

## Arguments

*queue* A GBBopen queue

*queue-element* A GBBopen queue element object

## Returns

The last queue element on *queue*.

## See also

**first-queue-element** (page [522](#))

**nth-queue-element** (page [528](#))

## Example

```
> (last-queue-element pending-ksas)
#<ksa 2372>
>
```

---

---

**make-queue** &rest *initargs* ⇒ *queue*

---

[Function]

## Purpose

Make a GBBopen queue.

**Package** : gbbopen

**Module** : queue

## Arguments

*initargs* An initialization argument list

*queue* A GBBopen queue

## Returns

The newly created queue.

## Errors

Use of an initialization argument that has not been declared as valid.

The supplied or generated instance name is identical to the instance name of an existing unit instance of *class*.

## See also

**queue** (page [532](#))

**ksa-queue** (page [610](#))

**ordered-queue** (page [530](#))

**ordered-ksa-queue** (page [613](#))

## Example

```
> (setf pending-ksas (make-queue :class 'ordered-ksa-queue
                                :key #'rating-of))
#<ordered-ksa-queue>
>
```

## Purpose

Apply a function to each queue element on the specified *queue*.

## Method signatures

`map-queue` (*function* *t*) (*queue* *queue*)

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*function* A function designator specifying a function object of one argument

*queue* A GBBopen queue

## Description

The *function* is applied to the queue elements in queue order (first to last).

## See also

**do-queue** (page [521](#))

**queue** (page [532](#))

**ordered-queue** (page [530](#))

## Example

Count the number of pending KSAs that were triggered by `hyp`:

```
> (let ((count 0))
      (map-queue #'(lambda (ksa)
                    (when (memq hyp (collect-trigger-instances ksa))
                        (incf& count)))
                pending-ksas)
      count)
31
>
```

---

**next-queue-element** *queue-element* ⇒ *next-queue-element*

---

[*Generic Function*]

## Purpose

Return the queue element that follows *queue-element* on a GBBopen queue.

## Method signatures

`next-queue-element` (*queue-element* `queue-element`) ⇒ *next-queue-element*

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*queue-element* A GBBopen queue element object

*next-queue-element* A GBBopen queue element object

## Returns

The queue element that follows *queue-element*.

## See also

**previous-queue-element** (page [531](#))

## Example

```
> (next-queue-element ksa)
#<ksa 2166>
>
```

---

**nth-queue-element** *n queue* ⇒ *queue-element*

---

[*Generic Function*]

## Purpose

Return the *n*th queue element on *queue*.

## Method signatures

`nth-queue-element` (*n* fixnum) (*queue* queue) ⇒ *queue-element* or nil

**Package** : gbbopen

**Module** : queue

## Arguments

*n* A fixnum

*queue* A GBBopen queue

*queue-element* A GBBopen queue element objec

## Returns

The specified queue element or nil if none exists.

## Description

Returns the *n*th element in *queue* (zero origin) or nil if the queue is shorter than *n*. If *n* is negative, return the *n*th element counting backward from the end of the queue (one origin).

## See also

**first-queue-element** (page [522](#))

**last-queue-element** (page [524](#))

## Examples

Return the first element on `pending-ksas` (equivalent to **first-queue-element**):

```
> (nth-queue-element 0 pending-ksas)
#<ksa 2217>
>
```

Return the last element on `pending-ksas` (equivalent to **last-queue-element**):

```
> (nth-queue-element -1 pending-ksas)
#<ksa 2372>
>
```

---

**on-queue-p** *queue-element* ⇒ *queue* or *nil*

---

[*Generic Function*]

## Purpose

Determine if *queue-element* resides on a queue by returning the queue or *nil*.

## Method signatures

`on-queue-p` (*queue-element* *queue-element*) ⇒ *queue*

**Package** : `gbbopen`

**Module** : `queue`

## Arguments

*queue-element* A GBBopen queue element object

*queue* A GBBopen queue

## Returns

The queue *queue* on which *queue-element* resides or *nil* if *queue-element* is not on a queue.

## See also

**queue-element** (page [533](#))

**show-queue** (page [536](#))

## Example

Return the queue on which `ksa` resides:

```
> (on-queue-p ksa)
#<ordered-queue>
>
```

**Package** : gbbopen

**Module** : queue

### Description

The unit class whose instances are used as the header of ordered (sorted) GBBopen queues.

### See also

**clear-queue** (page [520](#))  
**executed-ksas-of** (page [602](#))  
**make-queue** (page [525](#))  
**obviated-ksas-of** (page [611](#))  
**on-queue-p** (page [529](#))  
**ordered-ksa-queue** (page [613](#))  
**queue** (page [532](#))  
**queue-element** (page [533](#))  
**show-queue** (page [536](#))

---

---

**previous-queue-element** *queue-element* ⇒ *previous-queue-element*

---

[*Generic Function*]

## Purpose

Return the queue element that precedes *queue-element* on a GBBopen queue.

## Method signatures

*previous-queue-element* (*queue-element* *queue-element*) ⇒ *previous-queue-element*

**Package** : gbbopen

**Module** : queue

## Arguments

*queue-element* A GBBopen queue element object

*previous-queue-element* A GBBopen queue element object

## Returns

The queue element that precedes *queue-element*.

## See also

**next-queue-element** (page [527](#))

## Example

```
> (previous-queue-element ksa)
#<ksa 2166>
>
```

**Package** : gbbopen

**Module** : queue

### Description

The unit class whose instances are used as the header of GBBopen queues.

### See also

**clear-queue** (page [520](#))

**ksa-queue** (page [610](#))

**make-queue** (page [525](#))

**ordered-queue** (page [530](#))

**queue-element** (page [533](#))

**show-queue** (page [536](#))

---

**Package** :gbbopen

**Module** :queue

### Description

Objects that inherit from the unit class **queue-element** can be elements of GBBopen queues.

### See also

**on-queue-p** (page [529](#))

**ordered-queue** (page [530](#))

**queue** (page [532](#))

### Example

Define a KS activation class whose instances can be kept in a queue of pending KSAs:

```
(define-unit-class ksa (standard-unit-instance queue-element)
  ((rating
    :initform -1
    :type rating)
   ... ))
```

---

**queue-length** *queue* &optional *recount-p* ⇒ *integer*

---

[Generic Function]

## Purpose

Return the length of *queue*.

## Method signatures

`queue-length` (*queue* *queue*) &optional *recount-p* ⇒ *integer*

**Package** : gbbopen

**Module** : queue

## Arguments

*queue* A GBBopen queue

*recount-p* If true, actually counts the individual queue elements (default is `nil`)

*integer* An integer

## Returns

The *queue* length.

## Description

Normally **queue-length** simply returns a count that is maintained with the queue. Although highly unlikely, this count could become inaccurate if queue-element insertion or deletion operations are aborted in process. If *recount-p* is true, the elements are actually counted and then the count maintained with the queue is updated and returned.

## Examples

Return the number of KSAs in the queue pending-ksas:

```
> (queue-length pending-ksas)
896
>
```

Count and then return the actual number of KSAs in the queue pending-ksas:

```
> (queue-length pending-ksas 't)
896
>
```

---

---

**remove-from-queue** *queue-element* ⇒ *queue-element*

---

[*Generic Function*]

## Purpose

Remove a queue element from its queue.

## Method signatures

remove-from-queue (*queue-element* queue-element) ⇒ *queue-element*

**Package** : gbbopen

**Module** : queue

## Arguments

*queue-element* A GBBopen queue element object

## Returns

The supplied *queue-element*.

## See also

**clear-queue** (page [520](#))

**insert-on-queue** (page [523](#))

## Example

```
> (remove-from-queue ksa)
#<ksa 2372>
>
```

---

---

## Purpose

Print the elements on *queue*.

## Method signatures

**show-queue** (*queue queue*) &key *start end show-element-function*

**Package** : gbbopen

**Module** : queue

## Arguments

*queue* A GBBopen queue  
*start* An integer specifying the first queue element to be shown (default is 0)  
*end* An integer specifying the last queue element to be shown or `nil` indicating that the last queue element is to be shown (default is `nil`)  
*show-element-function* A function designator specifying a function object of two arguments used to print each queue element line (default is `#'standard-show-queue-element`)

## See also

**clear-queue** (page [520](#))  
**executed-ksas-of** (page [602](#))  
**make-queue** (page [525](#))  
**obviated-ksas-of** (page [611](#))  
**ordered-ksa-queue** (page [613](#))  
**ordered-queue** (page [530](#))  
**queue** (page [532](#))  
**queue-element** (page [533](#))  
**on-queue-p** (page [529](#))  
**pending-ksas-of** (page [614](#))

## Example

Show the control shell's pending KSAs queue (early in a `:tutorial-example run`):

```
> (show-queue (pending-ksas-of (current-control-shell)))
0. #<ksa 7 random-walk-ks 100>
1. #<ksa 1 count-center-locations-ks 90>
2. #<ksa 4 print-walk-ks 80>(show-queue pending-ksas :end 5)
>
```

## 6 GBBopen Extensions

GBBopen extension modules provide support for journaling and for network streaming between GBBopen streamer nodes. Documentation for these entities is arranged into the following sections:

- streaming entities (Section [6.1](#))
- journaling entities (Section [6.2](#))
- networking-streaming entities (Section [6.3](#))

## 6.1 Streaming

The `:streaming` module provides common entities used with journaling (Section 6.2) and network streaming (Section 6.3).

The entities in this module are experimental and are subject to change.

---

**add-mirroring** *streamer* [*unit-class-or-instance-specifier*] &key *slot-names paths* [*Function*]

---

## Purpose

Add mirroring of one or more unit classes.

**Package** :gbbopen

**Module** :streaming

## Arguments

<i>streamer</i>	A streamer
<i>unit-class-or-instance-specifier</i>	An extended unit-class or instance specification (see below; default is $\tau$ )
<i>slot-names</i> or <i>slot-name</i>	A slot-name or list of slot-names (default is $\tau$ )
<i>paths</i> or <i>path</i>	A space-instance path regular expression (default is $(*)$ )

## Detailed syntax

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
  *atomic-unit-class* |  
  (*atomic-unit-class subclassing-specifier*) |  $\tau$

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

The *paths* argument is either the symbol  $\tau$  (indicating all space instances) or a list representing a regular expression where the following reserved symbols are interpreted as follows:

- = matches one occurrence in a space-instance path
- ? matches zero or one occurrence in a space-instance path
- + matches one or more occurrences in a space-instance path
- \* matches zero or more occurrences in a space-instance path
- ^ move to parent

## See also

**remove-mirroring** (page [560](#))

## Example

Add full mirroring of `hyp` unit instances to *streamer*:

```
(add-mirroring streamer 'hyp)
```

## Note

Unit-instance-specific mirroring is not yet implemented in GBBopen.

---

---

**add-to-broadcast-streamer** *streamer broadcast-streamer*

---

[Function]

## Purpose

Add a journal or network streamer to a broadcast streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A journal or network streamer.

*broadcast-streamer* A broadcast streamer

## Errors

## See also

**make-broadcast-streamer** (page [543](#))

**remove-from-broadcast-streamer** (page [546](#))

## Example

Add a network streamer to streamer node "you-too" to broadcast streamer broadcast-streamer:

```
> (add-to-broadcast-streamer
  (open-network-streamer "me" "you-too")
  broadcast-streamer)
#<broadcast-streamer 2 constituents>
>
```

---

**clear-streamer-queue** *streamer*

[*Function*]

---

### Purpose

Clear the contents of a streamer queue without writing its contents, emptying the queue for further queueing.

**Package** :gbbopen

**Module** :streaming

### Arguments

*streamer* A streamer

### See also

**with-queued-streaming** (page [563](#))

**write-streamer-queue** (page [565](#))

### Example

Clear streamer `*streamer*`:

```
(clear-streamer-queue *streamer* :tag (get-universal-time))
```

---

## Purpose

Close a journal or network streamer.

## Method signatures

`close-streamer` (*streamer* journal-streamer)

`close-streamer` (*streamer* network-streamer)

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A journal or network streamer

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation (only network streamers require threads).

## See also

**define-streamer-node** (page [573](#))

**find-streamer-node** (page [575](#))

**make-journal-streamer** (page [569](#))

**open-network-streamer** (page [578](#))

**open-streamer-p** (page [544](#))

**stream-of** (page [552](#))

## Example

Close the network streamer `*streamer*`:

```
(close-streamer *streamer*)
```

---

---

**make-broadcast-streamer** *streamers* ⇒ *broadcast-streamer*

---

[Function]

## Purpose

Create a broadcast streamer that can be used to write to multiple journal and network streamers.

## Alternate syntax

`make-broadcast-streamer` &key *package read-default-float-format external-format* ⇒  
*broadcast-streamer*

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamers* A list of journal or network streamers.  
*package* A package designator indicating the package to be used when writing to and reading from the streamers associated with the *broadcast-streamer* (default is :common-lisp)  
*read-default-float-format* One of the atomic type specifiers *short-float*, *single-float*, *double-float*, or *long-float* to be used when to and reading from the streamers associated with the *broadcast-streamer* (default is *single-float*)  
*external-format* An external-file-format designator (default is :default)  
*broadcast-streamer* A broadcast streamer

## Errors

## See also

**add-to-broadcast-streamer** (page [540](#))  
**remove-from-broadcast-streamer** (page [546](#))  
**stream-of** (page [552](#))

## Examples

Create a broadcast streamer containing network streamers to streamer nodes "you" and "you-too":

```
> (make-broadcast-streamer
  (open-network-streamer "me" "you")
  (open-network-streamer "me" "you-too"))
#<broadcast-streamer 2 constituents>
>
```

Create a broadcast streamer with no constituents to be used with UTF-8 streamers:

```
> (make-broadcast-streamer :external-format 'utf-8)
#<broadcast-streamer 0 constituents>
>
```

---

**open-streamer-p** *streamer* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a journal or network streamer is open.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A journal or network streamer

## Returns

True if the streamer is open; otherwise `nil`.

## See also

**close-streamer** (page [542](#))

**find-streamer-node** (page [575](#))

**make-journal-streamer** (page [569](#))

**open-network-streamer** (page [578](#))

**stream-of** (page [552](#))

## Example

Check if the network streamer `*streamer*` is open:

```
> (open-streamer-p *streamer*)  
t
```

---

## Purpose

Reads a queued-streaming block.

## Method signatures

`read-queued-streaming-block` (*tag t*) *string-stream*

**Package** :gbbopen

**Module** :streaming

## Arguments

*tag* An object

*string-stream* An input string stream

## Description

**read-queued-streaming-block** is called when a queued-streaming block is read; it should not be called directly.

## See also

**with-queued-streaming** (page [563](#))

**write-streamer-queue** (page [565](#))

## Examples

Write a method that prints the time a queued-streaming block was started (recorded as the block's *tag*) when the block is read from a journal file or network-streamer connection:

```
(defmethod read-queued-streaming-block :around ((tag integer)
                                               string-stream)
  (declare (ignorable string-stream))
  (format t "~&; Reading ~a queued-streaming block...~%"
          (full-date-and-time tag))
  (call-next-method)
  (format t "~&; Reading queued-streaming block completed.~%"))
```

Write a method that prints a notice when an empty queued-streaming block (tagged with the *tag* :empty) has been read:

```
(defmethod read-queued-streaming-block :after ((tag (eql ' :empty))
                                               string-stream)
  (declare (ignorable string-stream))
  (format t "~&; An empty queued-streaming block was read.~%"))
```

---

**remove-from-broadcast-streamer** *streamer broadcast-streamer*

---

[Function]

## Purpose

Remove a journal or network streamer from a broadcast streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A journal or network streamer.

*broadcast-streamer* A broadcast streamer

## Errors

### See also

**make-broadcast-streamer** (page [543](#))

**add-to-broadcast-streamer** (page [540](#))

## Example

Remove the network streamer to streamer node "you-too" from broadcast streamer

broadcast-streamer:

```
> (remove-from-broadcast-streamer
   (open-network-streamer "me" "you-too")
   broadcast-streamer)
#<broadcast-streamer 1 constituent>
>
```

---

**stream-add-instance-to-space-instance** *unit-instance space-instance-or-path* [Function]  
*streamer* ⇒ *instance*

---

## Purpose

Write adding a unit instance to a space instance to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* The added unit instance

*space-instance-or-path* The space instance or space-instance path to which the unit instance is added

*streamer* A streamer

## Returns

The *unit-instance*.

## See also

**stream-delete-instance** (page [548](#))

**stream-instance** (page [549](#))

**stream-instances** (page [550](#))

**stream-instances-of-class** (page [551](#))

**stream-instances-on-space-instances** (page [553](#))

**stream-remove-instance-from-space-instance** (page [558](#))

## Examples

Stream to streamer *\*streamer\** the addition of a highly plausible hypothesis unit instance, good-hyp, to the hyps space instance:

```
> (stream-add-instance-to-space-instance
   good-hyp (find-space-instance-by-path '(bb hyps)))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

or

```
> (stream-add-instance-to-space-instance good-hyp '(bb hyps))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**stream-delete-instance** *unit-instance streamer* ⇒ *instance*

---

[*Function*]

## Purpose

Write deleting a unit instance (or space instance) to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* A unit instance (or space instance)

*streamer* A streamer

## Returns

The *unit-instance*.

## See also

**stream-add-instance-to-space-instance** (page [547](#))

**stream-instance** (page [549](#))

**stream-instances** (page [550](#))

**stream-instances-of-class** (page [551](#))

**stream-instances-on-space-instances** (page [553](#))

**stream-remove-instance-from-space-instance** (page [558](#))

## Example

Stream deleting a hyp unit instance to streamer *\*streamer\**:

```
> (stream-delete-instance (find-instance-by-name 419 'hyp) *streamer*)
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**stream-instance** *unit-instance streamer* ⇒ *instance*

---

[*Function*]

## Purpose

Write a unit instance (or space instance) to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* A unit instance (or space instance)

*streamer* A streamer

## Returns

The *unit-instance*.

## See also

**stream-add-instance-to-space-instance** (page [547](#))

**stream-delete-instance** (page [548](#))

**stream-instances** (page [550](#))

**stream-instances-of-class** (page [551](#))

**stream-instances-on-space-instances** (page [553](#))

**stream-remove-instance-from-space-instance** (page [558](#))

## Example

Stream a hyp unit instance to streamer *\*streamer\**:

```
> (stream-instance (find-instance-by-name 419 'hyp) *streamer*)
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

## Purpose

Write a list of unit instances (and space instances) to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*instances* A list of unit instances (and space instances)

*streamer* A streamer

## Returns

The *instances*.

## See also

**stream-add-instance-to-space-instance** (page [547](#))

**stream-delete-instance** (page [548](#))

**stream-instance** (page [549](#))

**stream-instances-of-class** (page [551](#))

**stream-instances-on-space-instances** (page [553](#))

**stream-remove-instance-from-space-instance** (page [558](#))

## Example

Stream the results of a blackboard retrieval to streamer *\*streamer\**:

```
> (stream-instances (find-instances 'hyp (find-space-instance-by-path ' (bb
hyps))
                    '(and (= x 1835) (> belief .8)))
  *streamer*)
(#<hyp 319 (1835 8419) 0.91 [4..12]>
 #<hyp 331 (1835 8419) 0.88 [15..30]>
 #<hyp 335 (1835 8419) 0.92 [15..35]>
 #<hyp 183 (1835 4791) 0.82 [0..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>
 #<hyp 419 (1835 4791) 0.85 [5..35]>)
>
```

## Purpose

Write all unit instances of the specified unit classes to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-classes-specifier* An extended unit-classes specification (see below)

*streamer* A streamer

## Detailed syntax

*unit-classes-specifier* ::=  $\tau$  | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## See also

**stream-add-instance-to-space-instance** (page [547](#))

**stream-delete-instance** (page [548](#))

**stream-instance** (page [549](#))

**stream-instances** (page [550](#))

**stream-instances-on-space-instances** (page [553](#))

**stream-remove-instance-from-space-instance** (page [558](#))

## Example

Stream all unit instances of the unit class `hyp` to streamer `*streamer*`:

```
(stream-instances-of-class 'hyp *streamer*)
```

---

## Purpose

Return the stream associated with a journal or network streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A journal or network streamer

## Returns

The associated stream if the streamer is open; otherwise `nil`.

## See also

**close-streamer** (page [542](#))

**find-streamer-node** (page [575](#))

**make-journal-streamer** (page [569](#))

**open-network-streamer** (page [578](#))

**open-streamer-p** (page [544](#))

## Example

Get the output file stream of the journal streamer `*streamer*`:

```
> (stream-of *streamer*)  
#<output file stream "<homedir>/tutorial.jnl">
```

---

**stream-instances-on-space-instances** *unit-classes-specifier space-instances streamer* [*Function*]  
&key *pattern filter-before filter-after*  
*use-marking verbose*

---

## Purpose

Write unit instances on space instances, optionally selected by a retrieval pattern, to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-classes-specifier* An extended unit-classes specification (see below)

*space-instances* A space instance, a list of space instances, a space-instance path regular expression, or `t` (indicating all space instances)

*streamer* A streamer

*pattern* A retrieval pattern (see below; default is `t`)

*filter-before* A single-argument predicate to be applied before pattern-matching tests occur

*filter-after* A single-argument predicate to be applied after pattern-matching tests occur

*use-marking* A generalized boolean (default is **\*use-marking\***)

*verbose* A generalized boolean (default is **\*find-verbose\***)

## Detailed syntax

*unit-classes-specifier* ::= `t` | *single-unit-class-specifier* | (*single-unit-class-specifier*<sup>+</sup>)

*single-unit-class-specifier* ::= *atomic-unit-class* | (*atomic-unit-class subclassing-specifier*)

*atomic-unit-class* ::= *unit-class* | *unit-class-name*

*subclassing-specifier* ::= `:plus-subclasses` | `:no-subclasses` | `+` | `=`

The shorthand `+` subclasses specifier is equivalent to `:plus-subclasses` and `=` to `:no-subclasses`.

*pattern* ::= *subpattern* | `t` | `:all`

*subpattern* ::= *pattern-element* |  
(`not` *subpattern*) |  
(`and` *subpattern*<sup>\*</sup>) |  
(`or` *subpattern*<sup>\*</sup>)

*pattern-element* ::= (*pattern-op* *dimension-names* *pattern-values* *option*<sup>\*</sup>) |  
(*boolean-dimension-unary-pattern-op* *dimension-names* *option*<sup>\*</sup>)

*pattern-op* ::= *ordered-dimension-pattern-op* |  
*enumerated-dimension-pattern-op* |  
*boolean-dimension-binary-pattern-op*

*ordered-dimension-pattern-op* ::= *ordered-dimension-any-numeric-value-pattern-op* |  
*ordered-dimension-explicit-type-pattern-op*

*ordered-dimension-explicit-type-pattern-op* ::= *ordered-dimension-fixnum-pattern-op* |  
*ordered-dimension-short-float-pattern-op* |  
*ordered-dimension-single-float-pattern-op* |  
*ordered-dimension-double-float-pattern-op* |  
*ordered-dimension-long-float-pattern-op* |  
*ordered-dimension-pseudo-probability-pattern-op*

```

ordered-dimension-any-numeric-value-pattern-op ::= < | <= | >= | > | = | /= |
    within | covers | overlaps |
    abuts | starts | ends
ordered-dimension-fixnum-pattern-op ::= <& | <=& | >=& | >& | =& | /=& |
    within& | covers& | overlaps& |
    abuts& | starts& | ends&
ordered-dimension-short-float-pattern-op ::= <$& | <=$& | >=$& | >$& | =$& | /=& |
    within$& | covers$& | overlaps$& |
    abuts$& | starts$& | ends$&
ordered-dimension-single-float-pattern-op ::= <$ | <=$ | >=$ | >$ | =$ | /= $ |
    within$ | covers$ | overlaps$ |
    abuts$ | starts$ | ends$
ordered-dimension-double-float-pattern-op ::= <$$ | <=$$ | >=$$ | >$$ | =$ | /= $$ |
    within$$ | covers$$ | overlaps$$ |
    abuts$$ | starts$$ | ends$$
ordered-dimension-long-float-pattern-op ::= <$$$ | <=$$$ | >=$$$ | >$$$ | =$$$ | /= $$$ |
    within$$$ | covers$$$ | overlaps$$$ |
    abuts$$$ | starts$$$ | ends$$$
ordered-dimension-pseudo-probability-pattern-op ::= <% | <=% | >=% | >% | =% | /= % |
    within% | covers% | overlaps% |
    abuts% | starts% | ends%
enumerated-dimension-pattern-op ::= is | enumerated-dimension-explicit-test-pattern-op
enumerated-dimension-explicit-test-pattern-op ::= is-eq | is-eql | is-equal | is-equalp
boolean-dimension-binary-pattern-op ::= eqv
boolean-dimension-unary-pattern-op ::= true | false
dimension-names ::= dimension-name | (dimension-name+)
pattern-values ::= pattern-value |
    (pattern-value+) |
    (pattern-value+ . pattern-value) |
    # (pattern-value+)
pattern-value ::= point | interval | element | set
interval ::= (start end) | (start . end) | # (start end)

```

## Terms

*point* A number, infinity, or -infinity  
*start* A number or -infinity  
*end* A number or infinity  
*element* An object

## Description

A unit instance will be streamed only once, even if the unit instance resides on multiple space instances.

The *pattern*  $\dagger$  matches all unit instances whose dimension values overlap the dimensional extent of at least one space instance in *space-instances*. The *pattern* :all matches every unit instance on a space instance in *space-instances*, regardless of dimensional overlap.

Declared numeric (see page 143) and pseudo probability (see page 149) pattern operators are also supported, for example: =&, =\$&, =\$, =\$\$, =\$\$\$ , and =% and within&, within\$&, within\$, within\$\$, within\$\$\$ , and within%.

<b>stream-add-instance-to-space-instance</b>	(page <a href="#">547</a> )
<b>stream-delete-instance</b>	(page <a href="#">548</a> )
<b>stream-instance</b>	(page <a href="#">549</a> )
<b>stream-instances</b>	(page <a href="#">550</a> )
<b>stream-instances-of-class</b>	(page <a href="#">551</a> )
<b>stream-remove-instance-from-space-instance</b>	(page <a href="#">558</a> )

### Example

Stream all unit instances of the unit class `hyp` to streamer `*streamer*` that reside on the `(bb probable-hyps)` space instance that have a belief value greater than 0.5:

```
(stream-instances-on-space-instances 'hyp ' (bb probable-hyps) *streamer*
  :pattern '(> belief .5))
```

### Note

Fixnum overlaps comparisons can result in bignum computations if the combined intervals of the pattern and a candidate unit instance exceeds `most-positive-fixnum`.

---

**stream-instances-on-space-instances**

---

**stream-link** *unit-instance slot other-unit-instances streamer* ⇒ *other-unit-instances* [Function]

---

## Purpose

Write links added between a unit instance and one or more unit instances to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* A unit instance (or space instance)

*slot* A non-nil, non-keyword symbol naming the link slot or a slot meta object

*other-unit-instances* A unit instance, a link-pointer object, or a list of unit instances and link-pointer objects

*streamer* A streamer

## Returns

The supplied *other-unit-instances*.

## See also

**stream-nonlink-slot-update** (page [557](#))

**stream-unlink** (page [559](#))

## Example

Stream adding a link of `support-hyp` to the `supporting-hyps` link slot of the `hyp` unit instance `unit-instance` to streamer `*streamer*`:

```
> (stream-link unit-instance 'supporting-hyps support-hyp *streamer*)  
#<hyp 231 (1488 7405) 0.63 [0..8]>  
>
```

---

**stream-nonlink-slot-update** *unit-instance slot new-value streamer* ⇒ *new-value*

---

[*Function*]

## Purpose

Write an update to the value of a non-link slot of unit instance (or space instance) to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* A unit instance (or space instance)

*slot* A non-nil, non-keyword symbol naming the slot or a slot meta object

*new-value* An object

*streamer* A streamer

## Returns

The supplied *new-value*.

## See also

**stream-link** (page [556](#))

**stream-unlink** (page [559](#))

## Example

Stream a new belief value for a hyp unit instance to streamer *\*streamer\**:

```
> (stream-nonlink-slot-update (find-instance-by-name 419 'hyp)
  'belief 0.88 *streamer*)
0.88
>
```

---

**stream-remove-instance-from-space-instance** *unit-instance space-instance-or-path* [Function]  
*streamer* ⇒ *instance*

---

## Purpose

Write removing a unit instance from a space instance to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* The removed unit instance

*space-instance-or-path* The space instance or space-instance path from which the unit instance is removed

*streamer* A streamer

## Returns

The *unit-instance*.

## See also

**stream-add-instance-to-space-instance** (page [547](#))

**stream-delete-instance** (page [548](#))

**stream-instance** (page [549](#))

**stream-instances** (page [550](#))

**stream-instances-of-class** (page [551](#))

**stream-instances-on-space-instances** (page [553](#))

## Examples

### Examples

Stream to streamer *\*streamer\** the removal of an incorrect hypothesis unit instance, *incorrect-hyp*, from the *hyps* space instance:

```
> (stream-remove-instance-from-space-instance
    incorrect-hyp (find-space-instance-by-path '(bb hyps)))
#<hyp 311 (896 388) 0.68 [0..6]>
>
```

or

```
> (stream-remove-instance-from-space-instance incorrect-hyp '(bb hyps))
#<hyp 311 (896 388) 0.68 [0..6]>
>
```

---

**stream-unlink** *unit-instance slot other-unit-instances streamer* ⇒ *other-unit-instances* [*Function*]

---

## Purpose

Write links removed between a unit instance and one or more unit instances to a streamer.

**Package** :gbbopen

**Module** :streaming

## Arguments

*unit-instance* A unit instance (or space instance)

*slot* A non-`nil`, non-keyword symbol naming the link slot or a slot meta object

*other-unit-instances* A unit instance, a link-pointer object, or a list of unit instances and link-pointer objects

*streamer* A streamer

## Returns

The supplied *other-unit-instances*.

## See also

**stream-link** (page [556](#))

**stream-nonlink-slot-update** (page [557](#))

## Example

Stream removing a link of `support-hyp` from the `supporting-hyps` link slot of the `hyp` unit instance `unit-instance` to streamer `*streamer*`:

```
> (stream-unlink unit-instance 'supporting-hyps support-hyp *streamer*)
#<hyp 231 (1488 7405) 0.63 [0..8]>
>
```

---

**with-mirroring-disabled** (*option*<sup>\*</sup>) *declaration*<sup>\*</sup> *form*<sup>\*</sup>  $\Rightarrow$  *result*<sup>\*</sup>

---

[*Macro*]

## Purpose

Disable mirroring during evaluation of *forms*.

**Package** :gbbopen

**Module** :streaming

## Arguments

*option* No options are currently supported

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**add-mirroring** (page [539](#))

**remove-mirroring** (page [560](#))

**with-mirroring-enabled** (page [562](#))

## Example

Create a hyp without mirroring:

```
> (with-mirroring-disabled ()
  (make-instance 'hyp
    :location (list x y)
    :classification '(:car :truck)
    :color ':red
    :belief .85
    :velocity-range '(5 35)
    :supporting-hyps supporting-hyps))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**with-mirroring-enabled** (*option*<sup>\*</sup>) *declaration*<sup>\*</sup> *form*<sup>\*</sup>  $\Rightarrow$  *result*<sup>\*</sup>

---

[*Macro*]

## Purpose

Restore mirroring during evaluation of *forms*.

**Package** :gbbopen

**Module** :streaming

## Arguments

*option* No options are currently supported

*declaration* A declare expression (not evaluated)

*forms* An implicit **progn** of forms to be evaluated

*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## See also

**add-mirroring** (page [539](#))

**remove-mirroring** (page [560](#))

**with-mirroring-disabled** (page [561](#))

## Example

Create a *hyp* without mirroring, then add supporting-hypothesis links with mirroring:

```
> (with-mirroring-disabled
  (let ((hyp (make-instance 'hyp
    :location (list x y)
    :classification '(:car :truck)
    :color ':red
    :belief .85
    :velocity-range '(5 35))))
    (with-mirroring-enabled ()
      (linkf (supporting-hyps-of hyp) supporting-hyps))
    hyp))
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

---

**with-queued-streaming** (*streamer* [*tag* [*write-empty-queue-p*]]) *form*\*  $\Rightarrow$  *result*\* [*Macro*]

---

## Purpose

Queue streaming during evaluation of *forms*.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A streamer  
*tag* An object (default is `nil`)  
*write-empty-queue-p* A generalized boolean (default is `nil`)  
*forms* An implicit **progn** of forms to be evaluated  
*results* The values returned by evaluating the last *form*

## Returns

The values returned by evaluating the last *form*.

## Description

Instead of writing changes directly to a streamer's journal file or network connection, the changes are queued until the last *form* has been evaluated. Then the queued changes are written as a block that is marked with the *tag* value. Queued streaming is thread-local (so different threads can have their own open queues at the same time) and **with-queued-streaming** forms can be nested within a single thread.

If the value of *write-empty-queue-p* is true, the streamer queue is written even if it is empty (and **read-queued-streaming-block** will be called with the *tag* value when the empty queue is received at a streamer node or read during journal loading).

## See also

**clear-streamer-queue** (page [541](#))  
**read-queued-streaming-block** (page [545](#))  
**write-streamer-queue** (page [565](#))

## Examples

Assuming that `hyp` unit instances are being mirrored to streamer `*streamer*`, queue the mirroring of a created `hyp` tagged with the space instance (`bb hyps`):

```
> (with-queued-streaming (*streamer* (find-space-instance-by-path ' (bb
hyps)))
  (make-instance 'hyp
    :location (list x y)
    :classification ' (:car :truck)
    :color ' :red
    :belief .85
    :velocity-range ' (5 35)
    :supporting-hyps supporting-hyps))
#<hyp 419 (1835 4791) 0.85 [5..35]>
```

---

>

**Write an empty queue (with tag :empty) to streamer \*streamer\*:**

```
> (with-queued-streaming (*streamer* ':empty 't))
nil
>
```

---

**with-queued-streaming**

---

**write-streamer-queue** *streamer* &key *tag* *write-empty-queue-p*

---

[Function]

## Purpose

Write the contents of a streamer queue, emptying it for further queueing.

**Package** :gbbopen

**Module** :streaming

## Arguments

*streamer* A streamer

*tag* An object (default is `nil`)

*write-empty-queue-p* A generalized boolean (default is `nil`)

## See also

**clear-streamer-queue** (page [541](#))

**read-queued-streaming-block** (page [545](#))

**with-queued-streaming** (page [563](#))

## Examples

Write the contents of streamer `*streamer*`, using and retaining the existing *tag* and *write-empty-queue-p* values associated with the queue:

```
(write-streamer-queue *streamer*)
```

Write the contents of streamer `*streamer*`, using the existing *tag* and *write-empty-queue-p* values associated with the queue (and retaining the *write-empty-queue-p* value), but establishing a new *tag* value for the emptied queue:

```
(write-streamer-queue *streamer* :tag (get-universal-time))
```

---

## 6.2 Journaling

Journal writing and reading is provided by the `:streaming` module.

The entities in this module are experimental and are subject to change.

---

**load-journal** *pathname* &key *class-name-translations coalesce-strings disable-events* [Function]  
*estimated-peak-forward-references external-format readtable read-eval*  
*retain-classes retain-event-functions retain-event-printing*  
⇒ *pathname, saved-time, saved-value*

---

## Purpose

Load a journal file.

**Package** : gbbopen

**Module** : streaming

## Arguments

<i>pathname</i>	A pathname designator
<i>class-name-translations</i>	An association list (default is <code>nil</code> )
<i>coalesce-strings</i>	A generalized boolean (default is <code>nil</code> )
<i>disable-events</i>	A generalized boolean (default is <code>t</code> )
<i>estimated-peak-forward-references</i>	An integer (default is *default-estimated-peak-forward-references*)
<i>external-format</i>	An external-file-format designator (default is <code>:default</code> )
<i>readtable</i>	A readtable (default is *reading-saved/sent-objects-readtable*)
<i>read-eval</i>	A generalized boolean (default is <code>nil</code> )
<i>retain-classes</i>	An extended unit-classes specification (see below)
<i>retain-event-functions</i>	A generalized boolean (default is <code>nil</code> )
<i>retain-event-printing</i>	A generalized boolean (default is <code>nil</code> )
<i>pathname</i>	A pathname
<i>saved-time</i>	A Universal Time
<i>saved-value</i>	An object

## Returns

Three values: the pathname of the journal file, the time when the journal was started, and the save value specified when the journal was created.

## Description

If *pathname* does not specify a file type, the type `jnl` is added to it. Then, `(user-homedir-pathname)` is used to supply any missing components to *pathname*.

The *class-name-translations* association list, if specified, should contain conses of the form:

`(class-name . new-class-name)`

for any class translations that should occur during repository loading.

If *coalesce-strings* is true, loaded strings that are `equal` become shared (`eq`). This coalescing is performed using a temporary hash table whose initial size can be specified by providing an integer value for *coalesce-strings*. If a hash table is provided as the value for *coalesce-strings*, it is used in place of the temporary hash table.

Unit instances that are referenced before they are defined are recorded using a temporary hash table whose initial size can be specified by providing an integer value for *estimated-peak-forward-references*.

## See also

**make-journal-streamer** (page [569](#))

**save-blackboard-repository** (page [514](#))

**with-reading-saved/sent-objects-block** (page [516](#))

## Example

Load the GBBopen Tutorial Example application (without running it) and then load a journal that was written previously:

```
> :tutorial-example :noautorun
...
> (load-journal "tutorial")
;; 35 temporarily forward-referenced instances (peak count)
#P"<homedir>/tutorial.jnl"
3429178245
#<path 1>
>
```

---

## load-journal

---

**make-journal-streamer** *pathname* &key *external-format* *package* [Function]  
*read-default-float-format* *value* ⇒ *journal-streamer*

---

## Purpose

Create a journal streamer to record to a file changes made to unit instances (and space instances).

**Package** :gbbopen

**Module** :streaming

## Arguments

<i>pathname</i>	A pathname designator
<i>external-format</i>	An external-file-format designator (default is :default)
<i>package</i>	A package designator indicating the package to be used when writing the journal and when loading the journal file (default is :common-lisp)
<i>read-default-float-format</i>	One of the atomic type specifiers <code>short-float</code> , <code>single-float</code> , <code>double-float</code> , or <code>long-float</code> to be used when writing the journal and loading the journal file (default is <code>single-float</code> )
<i>value</i>	An object to be saved with the journal and returned when the journal file is loaded (default is <code>nil</code> )
<i>journal-streamer</i>	A journal streamer

## Returns

The created journal streamer.

## Description

If *pathname* does not specify a file type, the type `jnl` is added to it. Then, `(user-homedir-pathname)` is used to supply any missing components to *pathname*.

The size of the journal file can be reduced by specifying a *package* containing the majority of the symbols that are written to the file.

A **with-saving/sending-block**, with the *package* and *read-default-float-format* values, is established when writing to the journal.

## See also

<b>load-journal</b>	(page 567)
<b>omitted-slots-for-saving/sending</b>	(page 510)
<b>stream-instance</b>	(page 549)
<b>save-blackboard-repository</b>	(page 514)
<b>with-saving/sending-block</b>	(page 518)

## Example

Load the `:streaming` module followed by the GBBopen Tutorial Example application (without running it). Then write a journal file recording what occurred when taking a walk:

```
> :streaming
...
> :tutorial-example :noautorun
```

```
...
> (defparameter *streamer*
  (make-journal-streamer "tutorial" :package ':tutorial))
*streamer*
> *streamer*
#<journal-streamer "<homedir>/tutorial.jnl">
> (add-mirroring *streamer* 'standard-space-instance)
nil
> (add-mirroring *streamer* 'path)
nil
> (add-mirroring *streamer* 'location)
nil
> (take-a-walk)
;; Control shell 1 started
...
;; Explicit :stop issued by KS print-walk-ks
;; Control shell 1 exited: 41 cycles completed
;; Run time: 0.01 seconds
;; Elapsed time: 0 seconds
:stop
>
```

---

**make-journal-streamer**

## 6.3 Network Streaming

The `:network-streaming` module provides network streaming entities.

The entities in this module are experimental and are subject to change.

---

**\*default-network-stream-server-port\***

[*Variable*]

---

**Purpose**

Specifies the default service port for the network stream server at a streamer node.

**Package** :gbbopen

**Module** :network-streaming

**Value type** An integer or a string specifying the service port

**Initial value** 1968

**See also**

**define-streamer-node** (page [573](#))

---

---

**define-streamer-node** *name &key host port documentation external-format package* [Macro]  
*read-default-float-format* ⇒ *streamer-node*

---

## Purpose

Define or redefine a streamer node.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

<i>name</i>	An object naming the streamer node (not evaluated)
<i>host</i>	A 32-bit internet address or a string specifying the remote host (default "localhost")
<i>port</i>	An integer or a string specifying the service port (default is <b>*default-network-stream-server-port*</b> )
<i>documentation</i>	A documentation string or nil (default is nil)
<i>passphrase</i>	A string or nil (default is nil)
<i>external-format</i>	An external-file-format designator (default is :default)
<i>package</i>	A package designator indicating the package to be used when establishing a streaming connection to <i>node</i> (default is :common-lisp)
<i>read-default-float-format</i>	One of the atomic type specifiers <i>short-float</i> , <i>single-float</i> , <i>double-float</i> , or <i>long-float</i> to be used when establishing a streaming connection to <i>streamer-node</i> (default is <i>single-float</i> )
<i>authorized-nodes</i>	Needed (default is :all)
<i>accepted-streamer-node-class</i>	Needed (default is <i>accepted-streamer-node</i> )
<i>accepted-streamer-node-initargs</i>	Needed (default is nil)

## Returns

The newly defined or modified streamer node object.

## See also

**\*default-network-stream-server-port\*** (page [572](#))  
**close-streamer** (page [542](#))  
**find-streamer-node** (page [575](#))  
**open-network-streamer** (page [578](#))  
**open-streamer-p** (page [544](#))  
**stream-of** (page [552](#))

## Example

Define a streamer node:

```
> (define-streamer-node "me"  
  :host "127.0.0.1"  
  :package 'gbbopen-user  
  :passphrase "Who goes there?"  
  :authorized-nodes '("you"))
```

```
#<streamer-node "me">  
>
```

**Note**

Modifications to a streamer node object apply the next time that a network streamer is created for the streamer node—the changes do not affect an established network streamer.

---

**define-streamer-node**

---

**find-streamer-node** *name* ⇒ *streamer-node* or `nil`

---

[Function]

## Purpose

Return a streamer node given its name.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

*name* An object naming the streamer node.  
*errorp* A generalized boolean (default is `nil`)  
*streamer-node* A streamer node

## Returns

The streamer node named *name* or `nil`, if none has been defined.

## See also

**define-streamer-node** (page [573](#))

**open-network-streamer** (page [578](#))

## Examples

Return the streamer node named "master":

```
> (find-streamer-node "master")
#<streamer-node "master">
>
```

Find a non-existent streamer node:

```
> (find-streamer-node "missing")
nil
> (find-streamer-node "missing" 't)
Error: No streamer node named "missing"
>>
```

---

**kill-network-stream-server** *streamer-node* ⇒ *thread*

---

[*Function*]

## Purpose

Create a connection-server thread that accepts network-stream connections.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

*streamer-node* A local streamer node or its name

## Returns

True if the network-stream connection server was running when killed; `nil` otherwise.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**define-streamer-node** (page [573](#))

**find-streamer-node** (page [575](#))

**network-stream-server-running-p** (page [577](#))

**start-network-stream-server** (page [579](#))

## Example

Kill the network-stream connection server running at local streamer node "me":

```
> (kill-network-stream-server "me")  
t  
>
```

---

**network-stream-server-running-p** *streamer-node* ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a network-stream connection server for a local streamer node is running.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

*streamer-node* A local streamer node or its name

*boolean* A generalized boolean

## Returns

True if the network-stream connection server is alive; `nil` otherwise.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**define-streamer-node** (page [573](#))

**find-streamer-node** (page [575](#))

**kill-network-stream-server** (page [576](#))

**start-network-stream-server** (page [579](#))

## Example

See if the a network-stream connection server streamer node "me" is running:

```
> (network-stream-server-running-p "me")
t
>
```

---

**open-network-streamer** *streamer-node local-streamer-node* &rest *initargs*  
⇒ *network-streamer*

---

[Function]

## Purpose

Return a connection to an external streamer node (from the specified local streamer node), establishing a new connection if one does not already exist.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

*streamer-node* A non-local streamer node or its name

*local-streamer-node* A local streamer node or its name

*initargs* An initialization argument list

*network-streamer* A network streamer

## Returns

An open network streamer (either existing or newly created—see below).

## Description

If an open network streamer exists between *streamer-node* and *local-streamer-node*, that network streamer is returned. Otherwise, a new connection to *streamer-node* is established and a new network streamer is returned.

The class of the created network streamer is specified by the `streamer-class` slot of *streamer-node*.

## See also

**close-streamer** (page [542](#))

**define-streamer-node** (page [573](#))

**find-streamer-node** (page [575](#))

**network-stream-server-running-p** (page [577](#))

**open-streamer-p** (page [544](#))

**stream-of** (page [552](#))

## Example

Return a network streamer connecting streamer node "me" and streamer node "you":

```
> (open-network-streamer "me" "you")
#<network-streamer 127.0.0.1:1969>
>
```

---

**start-network-stream-server** *streamer-node* ⇒ *thread*

---

[Function]

## Purpose

Create a connection-server thread that accepts network-stream connections to a local streamer node.

**Package** :gbbopen

**Module** :network-streaming

## Arguments

*streamer-node* A local streamer node or its name

*thread* A thread

## Returns

The new connection-server thread *thread*.

## Errors

Threads (multiprocessing) is not supported on the Common Lisp implementation.

## See also

**define-streamer-node** (page [573](#))

**find-streamer-node** (page [575](#))

**kill-network-stream-server** (page [576](#))

## Example

Start a network-stream connection server at local streamer node "me":

```
> (start-network-stream-server "me")
#<thread Network Connection Server>
>
```

## 7 Agenda Control Shell

The Agenda Shell module, `:agenda-shell`, provides a responsive, agenda-based control shell.

Note that the Agenda Shell requires that the idle-loop process has been started on [CMUCL](#) and that multiprocessing has been started on [LispWorks](#). (An error message when the Agenda Shell is started will instruct you on what to do if this is not the case.)

---

**abort-ks-execution** <no arguments>

---

[*Function*]

### **Purpose**

Abort the currently executing KSA.

**Package** :agenda-shell

**Module** :agenda-shell

### **See also**

**exit-control-shell** (page [604](#))

### **Example**

Abort the currently executing KSA::

```
(abort-ks-execution)
```

---

---

**Purpose**

Returns the cycle number when a KSA was activated.

**Method signatures**

**activation-cycle-of** (*ksa* *ksa*) ⇒ *cycle-number*

**Package** :agenda-shell

**Module** :agenda-shell

**Arguments**

*ksa* A KSA

*cycle-number* An integer

**Returns**

The activation cycle number of *ksa*

**Description**

This generic function accesses the value stored in the `activation-cycle` `nonlink` slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

**See also**

**ksa** (page [609](#))

**Example**

Return the activation cycle of *ksa*:

```
> (activation-cycle-of ksa)
1192
>
```

---

**collect-trigger-instances** *source* ⇒ *trigger-instances*

---

[*Generic Function*]

## Purpose

Return the trigger unit instances of a KSA, an event, or a list of KSAs or events.

## Method signatures

`collect-trigger-instances (cons cons) ⇒ trigger-instances`

`collect-trigger-instances (event single-instance-event) ⇒ trigger-instances`

`collect-trigger-instances (ksa ksa) ⇒ trigger-instances`

`collect-trigger-instances (event multiple-instance-event) ⇒ trigger-instances`

`collect-trigger-instances (event non-instance-event) ⇒ nil`

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*source* A KSA, event, or a list of KSAs or events

*trigger-instances* A proper list

## Returns

The list of trigger unit instances

## See also

**sole-trigger-instance-of** (page [620](#))

## Example

Return the trigger unit instances of a KSA:

```
> (collect-trigger-instances ksa)
(#<hyp 419 (1835 4791) 0.85 [5..35]>
 #<hyp 233 (1835 4791) 0.89 [5..35]>)
>
```

---

**control-shell-running-p** <no arguments> ⇒ *boolean*

---

[*Function*]

## Purpose

Determine if a control shell is running.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*boolean* A generalized boolean

## Returns

True if the control shell is running; *nil* otherwise.

## See also

**start-control-shell** (page [622](#))

**restart-control-shell** (page [617](#))

## Example

See if the control shell is running:

```
> (control-shell-running-p)
nil
>
```

---

**current-control-shell** <no arguments> ⇒ *control-shell-or-nil*

---

[*Function*]

## Purpose

Return the object representing the current control shell.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*control-shell-or-nil* A `control-shell` object or `nil`

## Returns

The object representing the current control shell (in the current thread), if one can be determined; otherwise `nil`.

## See also

**control-shell-running-p** (page [585](#))

**start-control-shell** (page [622](#))

## Example

```
> (current-control-shell)
#<control-shell 1>
>
```

---

---

**define-ks** *ks-name* &key *activation-predicate* *enabled* *execution-function* *ks-class* *ksa-class* [Macro]  
*obviation-events* *obviation-predicate* *precondition-function* *rating*  
*retrigger-events* *retrigger-function* *revalidation-predicate* *trigger-events* ⇒ *ks*

---

## Purpose

Define or redefine a knowledge source (KS).

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

<i>ks-name</i>	A symbol naming the KS (not evaluated)
<i>activation-predicate</i>	A function designator specifying a function object of two arguments (the KS unit instance and the event object) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>enabled</i>	A generalized boolean (default is <code>t</code> )
<i>execution-function</i>	A function designator specifying a function object of one argument (the KSA unit instance) or <code>nil</code> (default is <code>nil</code> )
<i>ks-class</i>	A class or a symbol specifying a class (not evaluated)
<i>ksa-class</i>	A class or a symbol specifying a class (not evaluated)
<i>obviation-events</i>	An <i>event-specification</i> (see below, not evaluated)
<i>obviation-predicate</i>	A function designator specifying a function object of two arguments (the KSA unit instance and the event object) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>precondition-function</i>	A function designator specifying a function object of two arguments (the KS unit instance and the event object) or <code>nil</code> (default is <code>nil</code> )
<i>rating</i>	A rating (default is 1)
<i>retrigger-events</i>	An <i>event-specification</i> (see below, not evaluated)
<i>retrigger-function</i>	A function designator specifying a function object of two arguments (the KSA unit instance and the event object) or <code>nil</code> (default is <code>nil</code> )
<i>revalidation-predicate</i>	A function designator specifying a function object of one argument (the KSA unit instance) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>trigger-events</i>	An <i>event-specification</i> (see below, not evaluated)
<i>ks</i>	A KS

## Returns

The unit instance representing the KS

## Detailed syntax

*event-specification* ::= (*event-signature*\*)

*event-signature* ::= (*event-class-specifier*  
[*unit-class-or-instance-specifier*  
{:slot-name *slot-name*} | {:slot-names *slot-names*} |  
{:path *path*} | {:paths *paths*}])

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) | `t`

```
atomic-event-class ::= event-class | event-class-name
subeventing-specifier ::= :plus-subevents | :no-subevents + | =
```

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

```
unit-class-or-instance-specifier ::= unit-instance | (unit-instance*) |
                                   atomic-unit-class |
                                   (atomic-unit-class subclassing-specifier) | t
```

```
atomic-unit-class ::= unit-class | unit-class-name
subclassing-specifier ::= :plus-subclasses | :no-subclasses | + | =
```

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

A KS definition creates a unit instance of class *ks-class* which specifies how activations of the KS are created and executed. The lifetime of each KS activation involves the following sequence:

- When an event matching one of the event specifications in *trigger-events* occurs and the KS is enabled:
  - the *activation-predicate*, if specified, is called and must return true for potential activation to continue
  - the *precondition-function*, if specified, is called and must return an integer rating for potential activation to continue
- The KS is activated (a unit instance of class *ksa-class* is created) and given the rating returned by the *precondition-function* or the constant *rating* value defined for the KS if no *precondition-function* was specified. The current control-shell cycle number is stored in the *activation-cycle* slot of the KSA unit instance.
- The KSA is placed on the queue of pending KSAs.
- If an event matching one of the event specifications in *obviation-events* occurs, the *obviation-predicate*, if specified, is called. If it returns true, the pending KSA is removed from the pending KSAs queue, the current control-shell cycle number is stored in the *obviation-cycle* slot of the KSA, and the KSA is placed on the queue of obviated KSAs.
- If an event matching one of the event specifications in *retrigger-events* occurs, the *retrigger-function*, if specified, is called. A *retrigger-function* is often used to change the triggering context of the KSA or its rating.
- When the pending KSA is selected for execution (typically because has the highest rating above the *minimum-ksa-execution-rating* currently in effect for the control shell), the *revalidation-predicate*, if specified, is called. If the *revalidation-predicate* returns *nil*, the pending KSA is removed from the pending KSAs queue, the current control-shell cycle number is stored in the *obviation-cycle* slot of the KSA, and the KSA is placed on the queue of obviated KSAs.
- The pending KSA is removed from the pending KSAs queue, the current control-shell cycle number is stored in the *execution-cycle* slot of the KSA unit instance, and the *execution-function* is called.
- The executed KSA is placed on the queue of executed KSAs.

## KS functions and predicates

The Agenda Shell provides a rich set of KS functions and predicates to manage the progression of KSAs from initial triggering and activation through obviation or execution. A typical KS will only require a subset of these functions and predicates.

An *activation-predicate* is a function that is called with two arguments, the unit instance representing the KS and the object representing the triggering event. The *activation-predicate* should

return a generalized boolean that indicates whether the KS should continue to be considered for activation in response to the event. Typically, an *activation-predicate* is specified for a KS that does not require a *precondition-function* rating computation, but that does require an activate/don't-activate decision.

A *precondition-function* is a function that is called with two arguments, the unit instance representing the KS and the object representing the triggering event. The *precondition-function* should return one of the following sets of values:

- `nil` indicating the KS is not to be activated in response to the event
- `:stop` (and, optionally, additional values to be returned by the control shell) indicating that the control shell is to exit immediately
- An integer execution rating for the KSA (and, optionally, initialization arguments to be used when creating the KSA unit instance)

An *execution-function* is a function that implements the KS. When an activation of the KS is executed, this function is called with one argument, the unit instance representing the KSA. If the execution function returns the value `:stop` (and, optionally, a additional values to be returned by the control shell), the control shell will exit immediately.

An *obviation-predicate* is a function that is called with two arguments, the unit instance representing the KSA and the object representing the obviation event. The *obviation-predicate* should return a generalized boolean that indicates whether the KSA should be obviated.

A *retrigger-function* is a function that is called with two arguments, the unit instance representing the KSA and the object representing the retrigger event. The *retrigger-function* can perform whatever activities are needed in response to the event. Typically this involves augmenting the triggering context of the KSA or changing its execution rating.

A *revalidation-predicate* is a function that is called with one argument, the unit instance representing the KSA. The *revalidation-predicate* is called immediately before a KSA is executed and should return a generalized boolean that indicates whether the KSA should be executed (if true) or obviated (if false).

## Examples

Define an initial KS that is triggered when the control shell is started:

```
(define-ks initial
  :trigger-events ((control-shell-started-event))
  :execution-function #'initial-ks-function)
```

Define a KS named `aggregate-hyps` that is triggered whenever a `hyp` unit instance is created:

```
(define-ks aggregate-hyps
  :trigger-events ((instance-created-event hyp))
  :precondition-function #'aggregate-hyps-precondition-function
  :execution-function #'aggregate-hyps-ks-function)
```

**Note**

Unit-instance-specific KS triggers are not yet implemented in GBBopen.

---

**define-ks**

---

**define-ks-class** *ks-class-name* (*{superclass-name}*\*) (*{slot-specifier}*\*) *{class-option}*\* [Macro]  
⇒ *new-ks-class*

---

## Purpose

Define or redefine a ks class.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ks-class-name* A non-nil, non-keyword symbol that names the ks class

*superclass-name* A non-nil, non-keyword symbol that specifies a direct superclass of the ks class  
*ks-class-name*

*slot-specifiers* See below

*class-options* See below

*new-ks-class* A new or modified ks class object

## Returns

The newly defined or modified ks class object.

## Errors

The specified *superclass-names* do not include at least one ks class name. This error is signaled on class finalization.

## Detailed syntax

(Syntax shown in gray is not supported in GBBopen Version 1.5, but will become available in a future release.)

```
slot-specifier ::= slot-name |  
                  (nonlink-slot-name [nonlink-slot-option]) |  
                  (link-slot-name [link-slot-option])  
nonlink-slot-name ::= slot-name  
link-slot-name ::= slot-name  
link-slot-option ::= slot-option |  
                    {:link inverse-link-slot-specifier} |  
                    {:singular boolean} |  
                    {:sort-function function} |  
                    {:sort-key function}  
inverse-link-slot-specifier ::= (unit-class-name link-slot-name [:singular boolean]) |  
                               :reflexive  
nonlink-slot-option ::= slot-option |  
                        {:reader reader-function-name}* |  
                        {:writer writer-function-name}*  
slot-option ::= {:accessor reader-function-name}* |  
                {:allocation allocation-type} |  
                {:documentation string} |  
                {:initarg initarg-name}* |  
                {:initform form} |  
                {:type type-specifier}
```

```

class-option ::= (:abstract boolean) |
  (:default-initargs . initarg-list) |
  (:dimensional-values dimension-value-specifier*) |
  (:documentation string) |
  (:estimated-instances integer) |
  (:export-accessors boolean) |

  (:generate-accessors direct-slots-specifier) |
  (:generate-accessors-format {:prefix | :suffix}) |
  (:generate-accessors-prefix {string | symbol}) |
  (:generate-accessors-suffix {string | symbol}) |
  (:generate-initargs direct-slots-specifier) |
  (:initial-space-instances initial-space-instance-specifier) |
  (:instance-name-comparison-test instance-name-comparison-test) |
  (:metaclass class-name) |
  (:retain {boolean | :propagate}) |
  (:use-global-instance-name-counter boolean)
initial-space-instance-specifier ::= {space-instance-path+ | function}
dimension-value-specifier ::= incomposite-dv-specifier | composite-dv-specifier
incomposite-dv-specifier ::= (dimension-name dimension-value-spec dimension-value-place)
composite-dv-specifier ::= (dimension-name dimension-value-specifier
  composite-type dimension-value-place)
composite-type ::= :set | :sequence |
  {:ascending-series ordering-dimension-name} |
  {:descending-series ordering-dimension-name}
dimension-value-specifier ::= dimension-value-type |
  (ordered-dimension-value-type [ordered-comparison-type]) |
  (enumerated-dimension-value-type [enumerated-comparison-type]) |
  (boolean-dimension-value-type [boolean-comparison-type])
dimension-value-type ::= ordered-dimension-value-type |
  enumerated-dimension-value-type |
  boolean-dimension-value-type
ordered-dimension-value-type ::= :point | :interval | :mixed
enumerated-dimension-value-type ::= :element
boolean-dimension-value-type ::= :boolean
ordered-comparison-type ::= number | fixnum | short-float | single-float |
  double-float | long-float |
  pseudo-probability
enumerated-comparison-type ::= eq | eql | equal | equalp
boolean-comparison-type ::= t
dimension-value-place ::= {slot-name [slot-name]} | {function [slot-name]}
direct-slots-specifier ::= nil | t | included-slot-name* |
  {t :exclude excluded-slot-name*}

```

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eql`. The default *boolean-comparison-type* is `t`.

A *dimension-value-place* with two *slot-names* is allowed only for an `:interval` dimension-value specification.

## Terms

<i>class-name</i>	A non- <code>nil</code> , non-keyword symbol that names a class
<i>documentation</i>	A documentation string
<i>initarg-list</i>	An initialization argument list
<i>slot-name</i>	A non- <code>nil</code> , non-keyword symbol
<i>instance-name-comparison-test</i>	One of the four standardized hash table test function names: <code>eq</code> , <code>eql</code> , <code>equal</code> , or <code>equalp</code> (default for classes of metaclass <b>standard-unit-class</b> is <code>eql</code> )

## Description

A *dimension-value-place* with two *slot-names* can be specified only for `:interval` dimension-value types.

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class **ks**.

The `:metaclass` *class-name* class option, if specified, must be a subclass of **standard-unit-class**. The default metaclass value is also **standard-unit-class**.

## Inheritance of class options

The set of *dimensional-values* for a unit class is the union of the sets specified in the *dimensional-values* options of the class and its superclasses. When more than one dimension-value specification is supplied for a given dimension, the one supplied by the most specific class is used.

The effective *initial-space-instances* value for a unit class is the value specified in the definition of the most specific unit class. (No additive inheritance of *initial-space-instances* is performed.) If no definitions specify an *initial-space-instances* value, `nil` is used.

The *instance-name-comparison-test* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

If a *retain* value is not specified, a value of `:propagate` is used as the default if any parent unit classes have a `:propagate` retention value; otherwise `nil` is used as the default value.

The *use-global-instance-name-counter* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

<b>standard-unit-class</b>	(page <a href="#">369</a> )
<b>with-generate-accessors-format</b>	(page <a href="#">136</a> )

## Examples

Define a `ks` class, `ks-with-lock`, that has an additional slot containing a lock that can be used to synchronize operations on each defined `KS` of that class.

```
> (define-ks-class ks-with-lock ()
  ((lock :initform (make-lock :name "KS Lock"))))
#<standard-unit-class ks-with-lock>
>
```

Do the same, but with a mixin class:

```
> (define-unit-class ks-lock-mixin ()
    ((lock :initform (make-lock :name "KS Lock"))))
#<standard-unit-class ks-lock-mixin>
> (define-ks-class ks-with-lock (ks ks-lock-mixin)
    ())
#<standard-unit-class ks-with-lock>
>
```

---

**define-ks-class**

```

class-option ::= (:abstract boolean) |
  (:default-initargs . initarg-list) |
  (:dimensional-values dimension-value-specifier*) |
  (:documentation string) |
  (:estimated-instances integer) |
  (:export-accessors boolean) |
  (:export-class-name boolean) |
  (:export-slot-names direct-slots-specifier) |
  (:generate-accessors direct-slots-specifier) |
  (:generate-accessors-format {:prefix | :suffix}) |
  (:generate-accessors-prefix {string | symbol}) |
  (:generate-accessors-suffix {string | symbol}) |
  (:generate-initargs direct-slots-specifier) |
  (:initial-space-instances initial-space-instance-specifier) |
  (:instance-name-comparison-test instance-name-comparison-test) |
  (:metaclass class-name) |
  (:retain {boolean | :propagate}) |
  (:use-global-instance-name-counter boolean)
initial-space-instance-specifier ::= {space-instance-path+ | function}
dimension-value-specifier ::= incomposite-dv-specifier | composite-dv-specifier
incomposite-dv-specifier ::= (dimension-name dimension-value-spec dimension-value-place)
composite-dv-specifier ::= (dimension-name dimension-value-specifier
  composite-type dimension-value-place)
composite-type ::= :set | :sequence |
  {:ascending-series ordering-dimension-name} |
  {:descending-series ordering-dimension-name}
dimension-value-specifier ::= dimension-value-type |
  (ordered-dimension-value-type [ordered-comparison-type]) |
  (enumerated-dimension-value-type [enumerated-comparison-type]) |
  (boolean-dimension-value-type [boolean-comparison-type])
dimension-value-type ::= ordered-dimension-value-type |
  enumerated-dimension-value-type |
  boolean-dimension-value-type
ordered-dimension-value-type ::= :point | :interval | :mixed
enumerated-dimension-value-type ::= :element
boolean-dimension-value-type ::= :boolean
ordered-comparison-type ::= number | fixnum | short-float | single-float |
  double-float | long-float |
  pseudo-probability
enumerated-comparison-type ::= eq | eql | equal | equalp
boolean-comparison-type ::= t
dimension-value-place ::= {slot-name [slot-name]} | {function [slot-name]}
direct-slots-specifier ::= nil | t | included-slot-name* |
  {t :exclude excluded-slot-name*}

```

The default *ordered-comparison-type*, if unspecified, is `number`. The default *enumerated-comparison-type*, if unspecified, is `eql`. The default *boolean-comparison-type* is `t`.

A *dimension-value-place* with two *slot-names* is allowed only for an `:interval` dimension-value specification.

## Terms

<i>class-name</i>	A non- <code>nil</code> , non-keyword symbol that names a class
<i>documentation</i>	A documentation string
<i>initarg-list</i>	An initialization argument list
<i>slot-name</i>	A non- <code>nil</code> , non-keyword symbol
<i>instance-name-comparison-test</i>	One of the four standardized hash table test function names: <code>eq</code> , <code>eql</code> , <code>equal</code> , or <code>equalp</code> (default for classes of metaclass <b>standard-unit-class</b> is <code>eql</code> )

## Description

A *dimension-value-place* with two *slot-names* can be specified only for `:interval` dimension-value types.

Each *superclass-name* argument specifies a direct superclass of the new class. If the superclass list is empty, then the direct superclass defaults to the single class **ksa**.

The `:metaclass` *class-name* class option, if specified, must be a subclass of **standard-ksa-class**. The default metaclass value is also **standard-ksa-class**.

## Inheritance of class options

The set of *dimensional-values* for a unit class is the union of the sets specified in the *dimensional-values* options of the class and its superclasses. When more than one dimension-value specification is supplied for a given dimension, the one supplied by the most specific class is used.

The effective *initial-space-instances* value for a unit class is the value specified in the definition of the most specific unit class. (No additive inheritance of *initial-space-instances* is performed.) If no definitions specify an *initial-space-instances* value, `nil` is used.

The *instance-name-comparison-test* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

If a *retain* value is not specified, a value of `:propagate` is used as the default if any parent unit classes have a `:propagate` retention value; otherwise `nil` is used as the default value.

The *use-global-instance-name-counter* value is not inherited. If no value is specified in the unit-class definition, the default initialization value associated with the metaclass is used.

<b>standard-ksa-class</b>	(page <a href="#">621</a> )
<b>with-generate-accessors-format</b>	(page <a href="#">136</a> )

## Examples

Define a `ksa` class, `ksa-with-lock`, that has an additional slot containing a lock that can be used to synchronize operations on each KSA of that class.

```
> (define-ksa-class ksa-with-lock ()
    ((lock :initform (make-lock :name "KSA Lock"))))
#<standard-ksa-class ksa-with-lock>
>
```

Do the same, but with a mixin class:

```
> (define-unit-class ksa-lock-mixin ()
    ((lock :initform (make-lock :name "KSA Lock"))))
#<standard-unit-class ksa-lock-mixin>
> (define-ksa-class ksa-with-lock (ksa ksa-lock-mixin)
    ())
#<standard-ksa-class ksa-with-lock>
>
```

---

**define-ksa-class**

## Purpose

Print information about a knowledge source (KS).

## Method signatures

`describe-ks` (*ks-name* symbol)

`describe-ks` (*ks* ks)

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*unit-class-name* A unit-class or a symbol specifying a unit class.

## Description

The description is printed to the **\*standard-output\*** stream.

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

## Example

```
> (describe-ks 'start-control-shell-ks)

KS: start-control-shell-ks
  Trigger events:      ((control-shell-started-event))
  Precondition function: #<Function scse-precondition>
  Execution function:   #<Function scse-fn>
>
```

---

---

**ensure-ks** *ks-name* &key *activation-predicate* *enabled* *execution-function* *ks-class* [Function]  
*ksa-class* *obviation-events* *obviation-predicate* *precondition-function* *rating*  
*retrigger-events* *retrigger-function* *revalidation-predicate* *trigger-events* ⇒ *ks*

---

## Purpose

Programmatically define or redefine a knowledge source (KS).

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

<i>ks-name</i>	A symbol naming the KS
<i>activation-predicate</i>	A function designator specifying a function object of two arguments (the KS unit instance and the event object) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>enabled</i>	A generalized boolean (default is <code>t</code> )
<i>execution-function</i>	A function designator specifying a function object of one argument (the KSA unit instance) or <code>nil</code> (default is <code>nil</code> )
<i>ks-class</i>	A class or a symbol specifying a class
<i>ksa-class</i>	A class or a symbol specifying a class
<i>obviation-events</i>	An <i>event-specification</i> (see below)
<i>obviation-predicate</i>	A function designator specifying a function object of two arguments (the KSA unit instance and the event object) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>precondition-function</i>	A function designator specifying a function object of two arguments (the KS unit instance and the event object) or <code>nil</code> (default is <code>nil</code> )
<i>rating</i>	A rating (default is 1)
<i>retrigger-events</i>	An <i>event-specification</i> (see below)
<i>retrigger-function</i>	A function designator specifying a function object of two arguments (the KSA unit instance and the event object) or <code>nil</code> (default is <code>nil</code> )
<i>revalidation-predicate</i>	A function designator specifying a function object of one argument (the KSA unit instance) that returns a generalized boolean or <code>nil</code> (default is <code>nil</code> )
<i>trigger-events</i>	An <i>event-specification</i> (see below)
<i>ks</i>	A KS

## Returns

The unit instance representing the KS

## Detailed syntax

*event-specification* ::= (*event-signature*\*)

*event-signature* ::= (*event-class-specifier*  
[*unit-class-or-instance-specifier*  
[{:slot-name *slot-name*} | {:slot-names *slot-names*} |  
{:path *path*} | {:paths *paths*}]])

*event-class-specifier* ::= *atomic-event-class* | (*atomic-event-class* *subeventing-specifier*) | `t`

*atomic-event-class* ::= *event-class* | *event-class-name*  
*subeventing-specifier* ::= :plus-subevents | :no-subevents + | =

The shorthand + subevents specifier is equivalent to :plus-subevents and = to :no-subevents.

*unit-class-or-instance-specifier* ::= *unit-instance* | (*unit-instance*<sup>\*</sup>) |  
  *atomic-unit-class* |  
  (*atomic-unit-class subclassing-specifier*) | t

*atomic-unit-class* ::= *unit-class* | *unit-class-name*  
*subclassing-specifier* ::= :plus-subclasses | :no-subclasses | + | =

The shorthand + subclasses specifier is equivalent to :plus-subclasses and = to :no-subclasses.

## Description

This function is called to define or redefine a KS. It is the functional equivalent of **define-ks** and is called by the expansion of the **define-ks** macro. (See the description of **define-ks** for details of KS definition and redefinition.)

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

**ks-enabled-p** (page [607](#))

**undefine-ks** (page [627](#))

## Example

Define an initial KS that is triggered when the control shell is started:

```
(ensure-ks 'initial
  :trigger-events '((control-shell-started-event))
  :execution-function #'initial-ks-function)
```

---

ensure-ks

---

## Purpose

Returns the executed KSAs queue of *control-shell*.

## Method signatures

**executed-ksas-of** (*control-shell* control-shell) ⇒ *ksa-queue*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*control-shell* A *control-shell* object

*ksa-queue* A **ksa-queue** object

## Returns

The executed KSAs queue object.

## Description

This generic function accesses the **ksa-queue** stored in the `executed-ksas` link slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

## See also

<b>clear-queue</b>	(page <a href="#">520</a> )
<b>ksa</b>	(page <a href="#">609</a> )
<b>ksa-queue</b>	(page <a href="#">610</a> )
<b>make-queue</b>	(page <a href="#">525</a> )
<b>obviated-ksas-of</b>	(page <a href="#">611</a> )
<b>on-queue-p</b>	(page <a href="#">529</a> )
<b>pending-ksas-of</b>	(page <a href="#">614</a> )
<b>queue</b>	(page <a href="#">532</a> )
<b>queue-element</b>	(page <a href="#">533</a> )
<b>show-queue</b>	(page <a href="#">536</a> )

## Example

Show the control shell's pending KSAs queue (early in a `:tutorial-example run`):

```
> (show-queue (executed-ksas-of (current-control-shell)))
0. #<ksa 2 startup-ks 100>
1. #<ksa 3 random-walk-ks 100>
2. #<ksa 5 random-walk-ks 100>
3. #<ksa 6 random-walk-ks 100>
>
```

---

**execution-cycle-of** *ksa* ⇒ *cycle-number* or *nil*

[*Generic Reader*]

---

## Purpose

Returns the cycle number when a KSA was executed.

## Method signatures

`execution-cycle-of` (*ksa* *ksa*) ⇒ *cycle-number*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*cycle-number* An integer or *nil*

## Returns

The execution cycle number of *ksa* or *nil*, if *ksa* has not been executed

## Description

This generic function accesses the value stored in the `execution-cycle` nonlink slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

## See also

**ksa** (page [609](#))

## Example

Return the execution cycle of *ksa*:

```
> (execution-cycle-of ksa)
1237
>
```

---

**exit-control-shell** &rest *result-form*\*

[*Function*]

---

## Purpose

Exit the Agenda Shell.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*result-form* A form

## Errors

**Exit-control-shell** called outside the context of an executing control shell.

## See also

**abort-ks-execution** (page [582](#))

**control-shell-running-p** (page [585](#))

**current-control-shell** (page [586](#))

**restart-control-shell** (page [617](#))

**start-control-shell** (page [622](#))

## Example

Exit the Agenda Shell, indicating that a solution, *solution*, was found:

```
(exit-control-shell ':solution-found solution)
```

---

---

**find-ks-by-name** *ks-name* ⇒ *ks* or *nil*

---

[*Function*]

## Purpose

Return a KS unit instance given its name.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ks-name* A symbol naming the KS.

*ks* A KS

## Returns

The KS unit instance named *ks-name* or *nil*, if none has been defined.

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

## Example

Return the KS named `start-control-shell-ks`:

```
> (find-ks-by-name 'start-control-shell-ks)
#<ks start-control-shell-ks>
>
```

---

**ks**

[Unit Class]

---

**Package** :agenda-shell

**Module** :agenda-shell

### Description

The class **ks** is the default class of instances created by [define-ks](#).

### See also

[define-ks](#) (page [587](#))

[ksa](#) (page [609](#))

---

## Purpose

Determine if the specified KS is enabled for execution.

## Self syntax

(setf (ks-enabled-p *ks*) *boolean*) ⇒ *boolean*

## Method signatures

ks-enabled-p (*ks* *ks*) ⇒ *boolean*

(setf ks-enabled-p) *boolean* (*ks* *ks*) ⇒ *boolean*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ks* A KS

*boolean* A generalized boolean

## Returns

True if the KS is enabled for execution; nil otherwise.

## Description

This generic function accesses the value stored in the `enabled` `nonlink` slot of *ks*.

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

**undefine-ks** (page [627](#))

## Examples

See if KS *ks* is enabled for execution:

```
> (ks-enabled-p ks)
t
>
```

Now disable KS *ks*:

```
(setf (ks-enabled-p ks) nil)
```

Check once again:

```
> (ks-enabled-p ks)
nil
>
```

## Purpose

Returns the knowledge source (KS) unit instance of a KSA.

## Method signatures

`ks-of (ksa ksa) ⇒ ks`

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*ks* A KS

## Returns

The KS unit instance of *ksa*

## Description

This generic function accesses the value stored in the `ks` link slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

## See also

**ks** (page [606](#))

**ksa** (page [609](#))

## Example

Return the KS of a KSA:

```
> (ks-of ksa)
#<ks start-control-shell-ks>
>
```

---

**ksa**

[*Unit Class*]

---

**Package** :agenda-shell

**Module** :agenda-shell

**Description**

The class **ksa** is the default class of unit instances representing KS activations.

**See also**

**ks** (page [606](#))

---

**Package** :agenda-shell

**Module** :agenda-shell

### Description

The unit class whose instances are used as the header of KSA queues.

### See also

**queue** (page [532](#))  
**queue-element** (page [533](#))  
**show-queue** (page [536](#))

## Example

Show the control shell's obviated KSAs queue (early in a `:tutorial-example run`):

```
> (show-queue (obviated-ksas-of (current-control-shell)))  
The queue is empty.  
>
```

---

**obviation-cycle-of** *ksa* ⇒ *cycle-number* or *nil*

[*Generic Reader*]

---

## Purpose

Returns the cycle number when a KSA was obviated.

## Method signatures

**obviation-cycle-of** (*ksa* *ksa*) ⇒ *cycle-number*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*cycle-number* An integer or *nil*

## Returns

The obviation cycle number of *ksa* or *nil*, if *ksa* has not been obviated

## Description

This generic function accesses the value stored in the `obviation-cycle` nonlink slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

## See also

**ksa** (page [609](#))

## Example

Return the obviation cycle of *ksa*:

```
> (obviation-cycle-of ksa)
1211
>
```

**Package** :agenda-shell

**Module** :agenda-shell

### Description

The unit class whose instances are used as the header of ordered (sorted) KSA queues.

### See also

**clear-queue** (page [520](#))

**ksa** (page [609](#))

**ksa-queue** (page [610](#))

**make-queue** (page [525](#))

**on-queue-p** (page [529](#))

**ordered-queue** (page [530](#))

**pending-ksas-of** (page [614](#))

**queue** (page [532](#))

**queue-element** (page [533](#))

**show-queue** (page [536](#))

---

## Purpose

Returns the pending KSAs queue of *control-shell*.

## Method signatures

**pending-ksas-of** (*control-shell* *control-shell*) ⇒ *ordered-ksa-queue*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*control-shell* A *control-shell* object

*ordered-ksa-queue* An **ordered-ksa-queue** object

## Returns

The pending KSAs queue object.

## Description

This generic function accesses the **ordered-ksa-queue** stored in the *pending-ksas* link slot of *ksa*. This value is maintained by the Agenda Shell and should not be changed.

## See also

**clear-queue** (page [520](#))  
**executed-ksas-of** (page [602](#))  
**ksa** (page [609](#))  
**make-queue** (page [525](#))  
**obviated-ksas-of** (page [611](#))

**ordered-queue** (page [530](#))  
**queue-element** (page [533](#))  
**show-queue** (page [536](#))

## Example

Show the control shell's pending KSAs queue (early in a `:tutorial-example run`):

```
> (show-queue (pending-ksas-of (current-control-shell)))
0. #<ksa 7 random-walk-ks 100>
1. #<ksa 1 count-center-locations-ks 90>
2. #<ksa 4 print-walk-ks 80>(show-queue pending-ksas :end 5)
>
```

---

**rating**

[Type]

---

**Package** :agenda-shell

**Module** :agenda-shell

**Description**

An integer between most-negative-rating (-32768) and most-positive-rating (32767), inclusive. Ratings are used by the Agenda Shell to order pending KSAs.

---

## Purpose

Accesses the rating of a KSA.

## Self syntax

(setf (rating-of *ksa*) *rating*) ⇒ *rating*

## Method signatures

rating-of (*ksa* *ksa*) ⇒ *rating*

(setf rating-of) *rating* (*ksa* *ksa*) ⇒ *rating*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*rating* A rating

## Returns

The rating of *ksa*

## Description

This generic function accesses the value stored in the `rating` nonlink slot of *ksa*. This value is used by the Agenda Shell to determine when to execute the KSA.

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

**ksa** (page [609](#))

## Examples

Return the rating of a KSA:

```
> (rating-of ksa)
58
> (setf (rating-of ksa) 80)
80
> (rating-of ksa)
80
>
```

## Note

The rating of a pending KSA can be changed by using **setf** or related macros with this accessor.

---

---

**restart-control-shell** &key *instance-name* ⇒ *result*\*

---

[Function]

## Purpose

Restart the agenda shell named *instance-name*.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*instance-name* An object naming a control-shell instance (default is 1)

*results* (see below)

## Returns

One of the following sets of multiple values:

- `:quiescence`—If the control-shell scheduling loop is terminated due to quiescence (that is, no more executable KSAs remain in the queue of pending KSAs)
- `:stop` and (optionally) associated reasons, as multiple values—If one of the following conditions occurs:
  - The [exit-control-shell](#) function is called.
  - A precondition function or KS-execution function returns `:stop` and, optionally, associated reasons.
- *Result-values*—If the control-shell is terminated by calling [exit-control-shell](#).

## Events

A `control-shell-restarted-event` is signaled.

## Errors

The idle-loop process has not been started on [CMUCL](#). Multiprocessing has not been started on [LispWorks](#).

## See also

[abort-ks-execution](#) (page [582](#))

[control-shell-running-p](#) (page [585](#))

[current-control-shell](#) (page [586](#))

[exit-control-shell](#) (page [604](#))

[run-polling-functions](#) (page [303](#))

[start-control-shell](#) (page [622](#))

## Example

Restart the Agenda Shell (in this case, without any KSs defined):

```
> (restart-control-shell)
;; Control shell 1 restarting after cycle 2
;; No executable KSAs remain, exiting control shell
;; Control shell 1 exited: 4 cycles completed
;; Run time: 0 seconds
```

```
;; Elapsed time: 0 seconds  
:quiescence  
>
```

## Note

When a non-nil `:run-polling-functions` value is supplied to **start-control-shell** (the default on Common Lisp implementations without threads), **run-polling-functions** is called at the beginning of every control-shell-cycle and at one-half-second intervals when the Agenda Shell is hibernating due to quiescence.

---

## restart-control-shell

---

**sole-trigger-event-of** *ksa* ⇒ *event* or *nil*

[*Generic Function*]

---

## Purpose

Return the sole trigger event of a KSA.

## Method signatures

sole-trigger-event-of (*ksa* *ksa*) ⇒ *event* or *nil*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*event* An event object or *nil*

## Returns

The trigger event or *nil*, if one was not found for *ksa*

## Description

If more than one trigger event is found for *ksa*, an error is signaled.

## See also

**sole-trigger-instance-of** (page [620](#))

## Example

Return the (sole) trigger event of a KSA:

```
> (sole-trigger-event-of ksa)
#<instance-created-event hyp>
>
```

---

**sole-trigger-instance-of** *source* ⇒ *trigger-instance* or *nil*

---

[*Generic Function*]

## Purpose

Return the trigger unit instance of a KSA, event, or a list of KSAs or events.

## Method signatures

sole-trigger-instance-of (*cons* *cons*) ⇒ *trigger-instance* or *nil*

sole-trigger-instance-of (*event* *single-instance-event*) ⇒ *trigger-instance* or *nil*

sole-trigger-instance-of (*ksa* *ksa*) ⇒ *trigger-instance* or *nil*

sole-trigger-instance-of (*event* *multiple-instance-event*) ⇒ *trigger-instance* or *nil*

sole-trigger-instance-of (*event* *non-instance-event*) ⇒ *nil*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*source* A KSA, event, or a list of KSAs or events

*trigger-instance* A unit instance or *nil*

## Returns

The trigger unit instance or *nil*, if one was not found in *source*

## Description

Typically, **sole-trigger-instance-of** is called with a single KSA or single-instance event. If more than one trigger unit instance is found in *source*, an error is signaled.

## See also

**collect-trigger-instances** (page [584](#))

**sole-trigger-event-of** (page [619](#))

## Example

Return the (sole) trigger unit instance of a KSA:

```
> (sole-trigger-instance-of ksa)
#<hyp 419 (1835 4791) 0.85 [5..35]>
>
```

**Package** :agenda-shell

**Module** :agenda-shell

### Description

The class **standard-ksa-class** is the default class of ksa classes defined by [define-ksa-class](#). It is a subclass of [standard-unit-class](#).

### See also

[define-ksa-class](#) (page [595](#))

[print-instance-slots](#) (page [107](#))

[standard-unit-class](#) (page [369](#))

---

---

**start-control-shell** &rest *initargs* ⇒ *result*\*

[Function]

---

## Purpose

Start the Agenda Shell.

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*initargs* An initialization argument list (see below)

*results* (See below)

## Returns

One of the following sets of multiple values:

- `:quiescence`—If the control-shell scheduling loop is terminated due to quiescence (that is, no more executable KSAs remain in the queue of pending KSAs)
- `:stop` and (optionally) associated reasons, as multiple values—If one of the following conditions occurs:
  - The [exit-control-shell](#) function is called.
  - A precondition function or KS-execution function returns `:stop` and, optionally, associated reasons.
- *Result-values*—If the control-shell is terminated by calling [exit-control-shell](#).

## Events

A `control-shell-started-event` is signaled.

## Errors

The idle-loop process has not been started on [CMUCL](#). Multiprocessing has not been started on [LispWorks](#).

## Detailed syntax

Available *initargs* are:

<i>awaken-on-event</i>	A generalized boolean (default is <code>t</code> )
<i>continue-past-quiescence</i>	A generalized boolean (default is <code>nil</code> )
<i>fifo-queue-ordering</i>	A generalized boolean (default is <code>t</code> )
<i>hibernate-on-quiescence</i>	A generalized boolean (default is <code>nil</code> )
<i>minimum-ksa-execution-rating</i>	A rating (default is 1)
<i>instance-name</i>	An object naming this control-shell instance (default is 1)
<i>output-stream</i>	Control-shell output stream (default is <code>*trace-output*</code> )
<i>pause</i>	A generalized boolean (default is <code>nil</code> )
<i>print</i>	A generalized boolean (default is <code>t</code> )
<i>run-polling-functions</i>	A generalized boolean (default is <code>t</code> on non-threaded Common Lisp implementations; <code>nil</code> otherwise)
<i>save-executed-ksas</i>	A generalized boolean (default is <code>nil</code> )
<i>save-obviated-ksas</i>	A generalized boolean (default is <code>nil</code> )

<i>stepping</i>	Control-shell stepping options (default is <code>nil</code> )
<i>stepping-stream</i>	Control-shell stepping stream (default is <code>*query-io*</code> )

## Description

Many Agenda Shell behaviors can be customized by providing non-default values for the following *initargs*:

<code>:awaken-on-event</code>	A generalized boolean value indicating whether the control shell is to be awakened from hibernation when any event is signaled
<code>:continue-past-quiescence</code>	A generalized boolean value indicating whether the control shell loop should continue even when quiescence-event processing has failed to produce any executable KSAs; use with caution, as the control shell will only exit by an explicit call to <b>exit-control-shell</b>
<code>:fifo-queue-ordering</code>	A generalized boolean value that indicates a newly rated pending KSA is to be placed ahead of equally rated KSAs (first-in, first out) or after them (last-in, first out)
<code>:hibernate-on-quiescence</code>	A generalized boolean value that determines whether the control-shell will hibernate rather than exit when no executable KSA exists; this decision point is never reached when <code>:continue-past-quiescence</code> is true
<code>:minimum-ksa-execution-rating</code>	The minimum rating value that a pending KSA must have to be executed
<code>:output-stream</code>	The stream to be used for control shell output
<code>:pause</code>	A generalized boolean that determines whether the control shell should hibernate until awakened at the start of each cycle
<code>:print</code>	A generalized boolean that determines whether start, restart, and termination messages are printed by the control shell
<code>:run-polling-functions</code>	A generalized boolean that determines whether polling functions (provided by the <code>:polling-functions</code> module (see page 298)) are to be run at the start of each control-shell cycle
<code>:save-executed-ksas</code>	A generalized boolean that determines whether executed KSA instances are to be saved on the <code>executed-ksas</code> queue
<code>:save-obviated-ksas</code>	A generalized boolean that determines whether obviated KSA instances are to be saved on the <code>obviated-ksas</code> queue
<code>:stepping</code>	A list of stepping options (see below) indicating the kinds of control-shell stepping that are to be enabled initially, or the symbol <code>t</code> , indicating all stepping options are enabled
<code>:stepping-stream</code>	The stream to be used for control shell stepping

## Stepping options

The supported stepping options and their interpretations are as follows:

<code>:activation-predicate</code>	about to execute the activation predicate of a KS
<code>:ks-activation</code>	about to create a KS activation
<code>:ksa-execution</code>	about to execute a KS activation
<code>:obviation-predicate</code>	about to execute the obviation predicate of a KS
<code>:precondition-function</code>	about to execute the precondition function of a KS
<code>:process-event</code>	about to perform control-shell processing associated with an event

```

:quiescence          about to perform activities triggered by control-shell quiescence
:retrigger-function  about to execute the retrigger function of a KS
:retrigger-function  about to execute the revalidation predicate of a KS

```

## See also

```

control-shell-running-p (page 585)
current-control-shell   (page 586)
exit-control-shell      (page 604)
run-polling-functions   (page 303)
restart-control-shell    (page 617)

```

## Examples

Start the Agenda Shell (in this case, without any KSs defined):

```

> (start-control-shell)
;; Control shell 1 started
;; No executable KSAs remain, exiting control shell
;; Control shell 1 exited: 2 cycles completed
;; Run time: 0 seconds
;; Elapsed time: 0 seconds
:quiescence
>

```

Start the Agenda Shell (again without any KSs defined, but with stepping enabled):

```

> (start-control-shell :stepping 't)
;; Control shell 1 started
>> CS Step (cycle 1):
  About to signal quiescence... [? entered]
Stepping commands (follow with <Return>):
  d      Disable this kind of stepping (:quiescence)
  e      Enable another kind of stepping
  f      Evaluate a form
  h or ? Help (this text)
  q      Quit (disable all stepping and continue)
  s      Show enabled stepping kinds
  x      Exit control shell
  =      Describe the object of interest (bound to ==)
  +      Enable all stepping
  -      Disable all stepping
  <Space> Continue (resume processing)
>> CS Step (cycle 1):
  About to signal quiescence... [d entered]
:quiescence stepping disabled
>> CS Step (cycle 1):
  About to signal quiescence... [q entered]
All stepping disabled
;; No executable KSAs remain, exiting control shell
;; Control shell 1 exited: 2 cycles completed
;; Run time: 0 seconds
;; Elapsed time: 54 seconds
:quiescence
>

```

## Note

When a non-`nil` `:run-polling-functions` value is supplied to **start-control-shell** (the default on Common Lisp implementations without threads), **run-polling-functions** is called at the beginning of every control-shell-cycle and at one-half-second intervals when the Agenda Shell is hibernating due to quiescence.

---

**start-control-shell**

## Purpose

Returns the list of events that triggered a KSA

## Method signatures

`trigger-events-of` (*ksa* *ksa*) ⇒ *events*

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ksa* A KSA

*events* A proper list

## Returns

The list of events that triggered *ksa*

## Description

This generic function accesses the value stored in the `trigger-events` link slot of *ksa*.

## See also

**define-ks** (page [587](#))

**ks** (page [606](#))

**ksa** (page [609](#))

## Example

Return the events that triggered a KSA:

```
> (trigger-events-of ksa)
(#<instance-created-event #<hyp 233 (1835 4791) 0.89 [5..35]>)>
>
```

---

**undefine-ks** *ks-name* &rest *ignored-initargs* ⇒ *deleted-ks-unit-instance*

---

[*Macro*]

## Purpose

Undefine (delete) a knowledge source (KS).

**Package** :agenda-shell

**Module** :agenda-shell

## Arguments

*ks-name* A symbol naming the KS (not evaluated, but the remaining arguments are evaluated)

*ignored-initargs* The remaining initialization arguments are ignored

*deleted-ks-unit-instance* A KS unit instance or nil

## Returns

The deleted KS unit instance, if KS *ks-name* was undefined (deleted).

## Description

A KS is undefined by deleting the unit instance corresponding to the KS. The **undefine-ks** macro provides a convenient shortcut for undefining a KS by minimally editing the defining form (such as from within an editor buffer).

## See also

**define-ks** (page [587](#))

**ks-enabled-p** (page [607](#))

## Examples

Undefine the KS named *initial*. The following forms are all equivalent:

```
> (undefine-ks initial
   :trigger-events '((control-shell-started-event))
   :execution-function #'initial-ks-function)
#<deleted-unit-instance ks initial>
> (undefine-ks initial)
#<deleted-unit-instance ks initial>
> (delete-instance
   (find-instance-by-name 'initial '(ks :plus-subclasses)))
#<deleted-unit-instance ks initial>
> (delete-instance
   (find-instance-by-name 'initial '(ks +)))
#<deleted-unit-instance ks initial>
>
```

# Glossary

## **alist**

An association list.

## **association list**

A list of conses representing an association of keys with values. The car of each cons is the key and the cdr is the value associated with that key.

## **atomic operation**

A computation that, once started, is completed without being interrupted by another thread.

## **autorun forms**

Forms in a module file that are to be evaluated conditionally when the file is loaded based on the value of **\*autorun-modules\***. Part of the Module Manager Facility (see page 21).

## **blackboard repository**

The internal storage containing all unit instance and space instance objects and associated retrieval data structures.

## **boolean dimension**

A dimension of `:boolean` dimension type where `:boolean` dimension values are either true (non-nil) or false (nil).

## **broadcast streamer**

An object that is used as a saving or sending destination for multiple journal and network streamers.

## **circular list**

A list that has no termination because it includes an earlier portion of itself in its successive sublists.

## **class**

An object that uniquely (directly or indirectly) determines the structure and behavior of a set of other objects. Members of this set are called instances of the class.

## **class designator**

A class or a symbol that names a class.

## **class option**

An option that refers to a class as a whole or to all the slots of the class.

## **comparison type**

A symbol that indicates the way that dimension values are compared. For an `:ordered` dimension value, one of: `number`, `fixnum`, `short-float`, `single-float`, `double-float`, or `long-float`. For an `:enumerated` dimension value, one of: `eq`, `eql`, `equal`, or `equalp`. For a `:boolean` dimension value: `t`.

## **composite dimension value**

A dimension value that is a set, sequence, or series of dimension values.

## **condition variable**

A condition variable provides an atomic means for a thread to release a lock (or recursive lock) that it holds and go to sleep until it is awakened by another thread. Once awakened, the lock that it was holding is reacquired atomically before the awakened thread is allowed to do anything else. A Portable Threads condition-variable object includes the lock that is associated with the condition variable, and the condition-variable object can be used directly as a lock.

## **cons**

An object with two components called the **car** and the **cdr**. Conses are used to construct lists.

## **dimension**

A conceptual extent within which values that share some relationship can be placed. GBBopen uses dimensionality to relate the extent representations of unit instances, space instances, and retrieval patterns.

GBBopen supports three dimension types:

1. ordered dimensions (:ordered)
2. enumerated dimensions (:enumerated)
3. boolean dimensions (:boolean)

Real-world dimensions (such as time and location) can be represented as ordered dimensions.

### **dimension name**

A symbol used to identify a dimension. In general, two dimensions with different dimension types should not be given the same dimension name.

### **dimension type**

The interpretation associated with a dimension of a unit class, a space instance, or a retrieval pattern; one of :ordered, :enumerated, or :boolean.

### **dimension value**

The value that can be used to position a unit instance on a dimension in one or more space instances.

### **dimension-value type**

The interpretation associated with a dimension value of a unit instance; one of :point, :interval, :mixed (both points and intervals), :element, or :boolean. The dimension-value types :point, :interval, and :mixed indicate values in an ordered dimension, :element indicates a value in an enumerated dimension, and :boolean indicates a value in a boolean dimension.

### **dimensional extent**

The dimensions of a space instance.

### **dotted list**

A list that is terminated by a non-nil atom rather than the empty list, nil.

### **enumerated dimension**

A dimension of :enumerated dimension type where :element dimension values are individual elements from an extensible set of discrete elements.

### **ESET**

A keys-only table that automatically transitions between list and hash-table implementations. The keys are compared using eq.

### **ET**

A key-and-value table that automatically transitions between list and hash-table implementations. The keys are compared using eq.

### **event**

An activity that is noticed, and signaled, by GBBopen.

### **event class**

An object that is a subclass of [standard-event-class](#).

### **event function**

A function that is associated with one or more event specifications and is called whenever such an event occurs. (See **signal-event** for the required event-function arguments for each event metaclass.

### **event instance**

An object whose class is a subclass of [standard-event-instance](#).

**event metaclass**

One of five “types” of event. Every event class has one of the following event metaclasses: `non-instance-event-class`, `instance-event-class`, `space-instance-event-class`, `nonlink-slot-event-class`, or `link-slot-event-class`.

**executable KS activation**

A pending KS activation that meets the criteria for execution, such as having a rating above the minimum KSA execution rating in effect for the control shell.

**executed KS activation**

A KS activation that has completed execution and will, therefore, not be operated on again by the control shell.

**extended event-class specification**

A specification of one or more event classes as indicated by one of the following:

- a event class
- a symbol naming a event class
- a list containing one of the above followed by the keyword `:plus-subevents` or the keyword `:no-subevents`
- the symbol `t`, which is equivalent to `(standard-event-instance :plus-subevents)`

**extended unit-class specification**

A specification of one or more unit classes as indicated by one of the following:

- a unit class
- a symbol naming a unit class
- a list containing one of the above followed by the keyword `:plus-subclasses` or the keyword `:no-subclasses`
- the symbol `t`, which is equivalent to `(standard-unit-instance :plus-subclasses)`

**extended unit-class or instance specification**

A specification of one or more unit instances or one or more unit classes as indicated by one of the following:

- a unit class
- a symbol naming a unit class
- a list containing one of the above followed by the keyword `:plus-subclasses` or the keyword `:no-subclasses`
- the symbol `t`, which is equivalent to `(standard-unit-instance :plus-subclasses)`
- a unit instance
- a list of unit instances

**extended unit-classes specification**

A specification of one or more unit classes as indicated by one of the following:

- a unit class
- a symbol naming a unit class
- a list containing one of the above followed by the keyword `:plus-subclasses` or the keyword `:no-subclasses`
- a list of one or more of the above
- the symbol `t`, which is equivalent to `(standard-unit-instance :plus-subclasses)`

**feature**

A symbol in the list value of the variable `*features*`. The features in this features list are used to control conditional compilation and implementation-specific behaviors.

**form**

An object (including an expression) to be evaluated.

**function designator**

An object that specifies a function. Either: a symbol (denoting the function named by that symbol in the global environment), or a function object (denoting itself). The term “function” is often used to denote a function designator, with the term “function object” used when referring specifically to a function object.

**function object**

An object of type `function`. The term “function” is often used to denote a function designator, with the term “function object” used when referring specifically to a function object.

**fixnum**

An integer between `most-negative-fixnum` and `most-positive-fixnum` inclusive.

**generalized boolean**

An object used as a truth value, where `nil` represents false and all other objects represent true.

**generalized reference**

A reference to a location storing a value as if to a variable.

**generic function**

A function whose behavior depends on the classes or identities of the arguments supplied to it.

**incomplete unit instance**

A forward-referenced unit instance created during the loading of a blackboard repository or journal file or the reading of a network stream. An incomplete unit instance does not reside on any space instance or have all of its saved/sent slot values present until it becomes “complete” by loading or receiving a form containing the instance’s full details.

**incomposite dimension value**

A dimension value that is a single point, interval, element, or boolean (i.e., not a composite dimension value).

**initialization argument list**

A list of alternating names and values used to initialize or reinitialize instances of classes. If more than one name and value pair has the same name, only the first such pair is used to provide the value.

**instance**

An object whose structure and behavior is uniquely (directly or indirectly) determined by a class object.

**instance name**

An object that uniquely identifies an instance of a unit class. The same object can be used to identify instances of different unit classes, but the same instance name cannot be used with two instances of the same class.

**interval**

A cons, two-element list, or two-element array containing the start and end value representing the set of real numbers between them, inclusive.

**journal**

A file containing changes made to the blackboard repository that can be loaded in order to perform the recorded changes.

**journal streamer**

An object that is used as a saving destination for journaling functions.

**journaling**

Writing changes made to the blackboard repository to a file that can be loaded in order to perform the recorded changes. Journaling can be used with or without repository saving to recreate a blackboard repository.

**keyword symbol**

A symbol whose home package is the `keyword` package.

**knowledge source**

The expertise associated with a collaborating computational entity in a blackboard application (often abbreviated as “KS”). More specifically, a KS is an object containing the expertise and other information associated with a computational entity. A `ks` object is also a unit instance, but KSs are normally described by their more specific categorization.

**KS activation**

The application of a KS to a specific computational context (often abbreviated as “KSA”). More specifically, a KSA is a `ksa-class` object representing the KS activation. A `ksa` is also a unit instance, but they are normally described by their more specific categorization.

**KS execution**

The execution of a KS activation.

**ks class**

An object that is a subclass of `standard-unit-class` that is used to represent a KS.

**ksa class**

An object that is a subclass of `standard-ksa-class` that is used to represent a KSA.

**left-leaning red-black tree**

An LLRB tree.

**LLRB tree**

A binary search tree that is roughly balanced, keeping the worst-case time for operations such as inserting, deleting, and finding values proportional to the height of the tree. Left-leaning red-black (LLRB) trees are a simpler version of red-black trees introduced by Sedgwick in 2008 where all red links must lean left except during inserts and deletes.

**link**

A bi-directional relationship between two unit instances represented by a pair of pointers, one at each unit instance pointing to the other unit instance. GBBopen’s link operators maintain the bi-directional consistency of link pointers.

**link slot**

A slot designated for the outgoing pointers of links associated with that slot.

**link-pointer object**

An object that can be used as a pointer in a link slot. A link-pointer object must have a **link-instance-of** method defined for it whose result returns the unit instance to be used as the link pointer.

**link-slot place**

A form which is suitable for use as a generalized reference to a link slot. Typical examples of link-slot-place forms include:

```
(slot-accessor unit-instance)
(slot-value unit-instance slot-name)
```

where:

*slot-accessor* is a symbol specifying an accessor function for a link slot

*unit-instance* is a unit instance

*slot-name* is a symbol naming a link slot in *unit-instance*

**lock**

A mutual-exclusion object that allows multiple threads to synchronize activities or access to shared resources. A lock has two states, unlocked or locked by a specific thread. Once a lock is held by a thread, any other threads attempting to lock it will block. When the lock-holding

thread unlocks (releases) the lock, one of the blocked threads will acquire (lock) it and proceed. If the thread that is holding the lock attempts to re-acquire it, an error is signaled (see recursive lock).

**metaobject**

An instance of a metaobject class.

**metaobject class**

A class object that is a subclass of exactly one of the following classes: `class`, `slot-definition`, `generic-function`, `method`, and `method-combination`.

**module**

A set of related files that form a component, library, or application. Part of the Module Manager Facility (see page 21).

**namestring**

A string that represents a filename.

**network streamer**

An object that is used as a sending destination for network streaming functions.

**network streaming**

Sending unit instances (and space instances, changes made to the blackboard repository, and commands to a streamer node (typically in another Common Lisp image).

**non-keyword symbol**

A symbol whose home package is not the `keyword` package.

**obviated KS activation**

An unexecuted KS activation that has been deemed unnecessary and will therefore never be executed.

**Offset Universal Time**

A non-negative integer number of seconds measured from the beginning of a time base later than the year 1900 (ignoring leap seconds). Offset Universal Time is Universal Time that is offset by an integer time-base value so that the most often used Offset Universal Time values in an application are fixnums.

**ordered dimension**

A dimension of `:ordered` dimension type where `:point`, `:interval`, and `:mixed` dimension values are points or intervals on a continuous, real-number extent.

**ordering dimension**

The dimension whose dimension values are used to order a series-composite dimension value.

**ordered queue**

A doubly linked, ordered queue. A GBBopen queue is headed by an object that is a subclass of [ordered-queue](#).

**package designator**

A string designator (denoting a string that designates the name or nickname of a package) or a package (denoting itself).

**passive socket**

A socket that is used to accept a connection initiation to a specific service port.

**patch**

A modification to the existing code of an application that is loaded after the regular application code, either at startup or into an executing application.

**path expression**

A regular expression representing one or more space-instance paths.

**pathname**

A structured representation of the name of a file. A pathname has six components: host, device, directory, name, type, and version.

**pathname designator**

A namestring (denoting the corresponding pathname), a stream associated with a file (denoting the pathname used to open the file), or a pathname (denoting itself).

**pending KS activation**

A KS activation that has not been executed or obviated.

**periodic function**

A function of no arguments that is run repeatedly at a specified interval, at a resolution as brief as supported by `sleep`. A separate thread is spawned to manage the periodic invocations of the specified function.

A count can also be provided for the periodic function. When specified, this value is decremented prior to each invocation of the function and, when it is no longer positive, the periodic-function thread is terminated.

**predicate function**

A function that returns a generalized-boolean value.

**proper list**

A list terminated by the empty list. (The empty list is a proper list.)

**property**

(of a property list) 1. A pair of elements in a property list representing the name of a property and its associated value. 2. The value of a property.

**property list**

A list containing an even number of elements that represent alternating names (sometimes called indicators or keys) and their associated values.

**pseudo-probability**

A discretized `fixnum` representation for probability values that maps probability values in the range [0.0..1.0] to integers in the range [0..1000].

**pseudo-probability-ln**

A discretized `fixnum` representation for the natural logarithm of a pseudo-probability value. Pseudo-probability-ln values range from [-6907756..0].

**queue**

A doubly linked queue. A GBBopen queue is headed by an object that is a subclass of [queue](#). GBBopen queues that maintain a sorted ordering of queue elements are provided by ordered queues.

**queue element**

An object that is a subclass of [queue-element](#).

**quiescence**

A control-shell state when no more executable KSAs are in the queue of pending KSAs.

**rating**

An integer between -32768 and 32767 inclusive, used by the Agenda Shell to order pending KSAs (see [rating](#)).

**recursive lock**

A mutual-exclusion object that allows multiple threads to synchronize activities or access to shared resources. A recursive lock has two states, unlocked or locked by a specific thread. Once a recursive lock is held by a thread, any other threads attempting to lock it will block. When the lock-holding thread unlocks (releases) the recursive lock, one of the blocked threads will acquire (lock) it and proceed. If the thread that is holding the recursive lock attempts to re-acquire it,

that thread is allowed to proceed as if it had acquired the lock (without error or blocking, see lock).

**relative directory**

A directory defined in relation to another directory definition. Part of the Module Manager Facility (see page 21).

**REPL command**

A keyword command that can be entered at the top level read-eval-print loop (REPL) in your Common Lisp environment. REPL commands (some with arguments) provide convenient shortcuts for often-used operations.

**retrieval pattern**

A list argument to [filter-instances](#), [find-instances](#), and [map-instances-on-space-instances](#) specifying the dimension value requirements for selecting unit instances to be returned.

**required module**

A sequence of modules that must be compiled (if needed) and loaded, in order, before the requiring module is compiled (if needed) and loaded. Part of the Module Manager Facility (see page 21).

**root directory**

A fixed anchor directory for a tree of relative directory definitions. Part of the Module Manager Facility (see page 21).

**scheduled function**

An object that contains a function that may be scheduled to run at an absolute or relative time. When that specified time arrives, the function is invoked with a single argument: the scheduled-function object.

A repeat interval can also be specified for the scheduled function. When specified, this value is used whenever the function is invoked to schedule the function again at a new time relative to the current invocation.

Scheduled functions can be scheduled to a resolution of one second. Periodic function invocations at brief time intervals are provided by periodic functions.

**series-composite dimension value**

A dimension value that is a series of dimension values that are ordered by the dimension values of another dimension (the series-composite ordering dimension).

**series-composite ordering dimension**

The dimension whose values are used to order a series-composite dimension value.

**sequence-composite dimension value**

A dimension value that is a sequence of dimension values.

**set-composite dimension value**

A dimension value that is a set of dimension values.

**slot**

A component of an object that can store a value.

**space**

Pertaining to a space class or space instance.

**space class**

An object that is a subclass of [standard-space-class](#).

**space instance**

An object whose class is a subclass of [standard-space-instance](#). A space instance is also a unit instance, but space instances are normally described by their more specific categorization.

**space-instance path**

A complete list of space-instance names, starting with the most distant indirect parent space-instance name, that uniquely identifies a space instance in the blackboard repository.

**standard-gbbopen-instance**

An object whose class is a subclass of **standard-gbbopen-instance**. It is a superclass of **standard-event-instance** and **standard-unit-instance**.

**storage specification**

A specification of how unit instances are to be stored on a space instance.

**streamer**

An object that is used as a saving or sending destination for journaling or network-streaming functions.

**streamer node**

A logical “host” for sending and receiving streamed updates to unit instances and to the blackboard repository. Each streaming node is resolved uniquely by *host* and *port* and should be defined with a unique *name*. Although multiple streaming nodes can be defined for the same Common Lisp image, typically only one streaming node is defined per image.

**streamer queue**

A thread local queue of changes associated with a streamer that are being held until in memory until the queue is written or cleared.

**string designator**

An object that denotes a string. One of: a character (denoting a singleton string that has the character as its only element), a symbol (denoting the string that is its name), or a string (denoting itself).

**subclasses**

The classes that inherit from a class.

**subevents**

The classes that inherit from an event class.

**system name**

A keyword associating a set of REPL commands, directory definitions, and module definitions with a specific library or application.

**thread**

A thread in a multi-threaded Common Lisp implementation or a Lisp process in a Common Lisp that provides multiprocessing.

**thread-local binding**

A dynamic binding that is visible only to a single thread.

**three-way comparison test**

A function of two arguments that returns: a negative fixnum if the first argument is less than the second argument, zero if the two arguments are equal, and a positive fixnum if the first argument is greater than the second argument.

**time zone**

A rational number between -24 (inclusive) and 24 (inclusive) that represents a time zone as a number of hours offset from Greenwich Mean Time. A non-integral time zone must be a multiple of  $\frac{1}{3600}$ .

**unit**

Pertaining to a unit class or unit instance.

**unit class**

An object that is a subclass of **standard-unit-class**.

**unit instance**

An object whose class is a subclass of **standard-unit-instance**. A space instance is also a unit instance, but space instances are normally described by their more specific categorization.

**Universal Time**

A non-negative integer number of seconds measured from the beginning of the year 1900 (ignoring leap seconds).

**variable symbol**

A symbol that can accept a binding.

# Index

Page references are shown in **bold** when they refer to the definition or main source of information on the entry. A page reference that is given in *green italics* indicates an instructive example of the use of that entity.
